Zenon W. Pylyshyn, 2007 The author argues that the process of incrementally constructing perceptual representations solving the binding problem determining which properties go together and more generally grounding perceptual representations in experience arise from the nonconceptual capacity to pick out and keep track of a small number of sensory individuals He proposes a mechanism in early vision that allows us to select a limited number of sensory objects to reidentify each of them under certain conditions as the same individual seen before and to keep track of their enduring individuality despite radical changes in their properties all without the machinery of concepts identity and tenses This mechanism which he calls FINSTs for Fingers of Instantiation is responsible for our capacity to individuate and track several independently moving sensory objects an ability that we exercise every waking minute and one that can be understood as fundamental to the way we see and understand the world and to our sense of space
