Yuce,2013-10-16 This book investigates the design of devices systems and circuits for medical applications using the two recently established frequency bands ultra wideband 3.1-10.6 GHz and 60 GHz ISM band These two bands provide the largest bandwidths available for communication technologies and present many attractive opportunities for medical applications The applications of these bands in healthcare are wireless body area network WBAN medical imaging biomedical sensing wearable and implantable devices fast medical device connectivity video data transmission and vital signs monitoring

The recent technological advances and developments proposed or used in medicine based on these two bands are covered. The book introduces possible solutions and design techniques to efficiently implement these systems in medical environment. All individual chapters are written by leading experts in their fields. Contributions by authors are on various applications of ultra wideband and the 60 GHz ISM band including circuit implementation UWB and 60 GHz signal transmission around and in body antenna design solution hardware implementation of body sensors UWB transceiver design 60 GHz transceiver design UWB radar for contactless respiratory monitoring and ultra wideband based medical Imaging. The book will be a key resource for medical professionals bio medical engineers and graduate and senior undergraduate students in computer electrical electronic and biomedical engineering disciplines. **PC Mag**, 1987-11-10 PCMag.com is a leading authority on technology delivering Labs based independent reviews of the latest products and services. Tools Jim X. Chen, 2007-08-23 Many scientists in different disciplines realize the power of graphics but are also bewildered by the complex implementations of a graphics system and numerous graphics tools. More often than not they choose the wrong software tools and end up with unsatisfactory results. Hopefully if we know how a graphics system works and what basic functions many graphics tools provide we can understand and employ some graphics tools without spending much precious time on learning all the details that may not be applicable and we can become graphics experts through such a shortcut. **Overview** This book aims to be a shortcut to graphics theory programming tools and applications. It covers all graphics basics and several advanced topics without including some implementation details that are not necessary in graphics applications. It categorizes current graphics tools according to their applications and provides many weblinks to important resources on the Internet. The purpose is to provide an exhaustive list of graphics tools with their major applications and functions. The reference list may contain some inaccuracies since new tools are constantly emerging. **VI Preface** and old tools become obsolete. Through explaining and categorizing these graphics tools and their primary applications we hope to provide learners and researchers with different means and application areas in computer graphics and help them understand and use visualization modeling animation simulation virtual reality and many online resources.

Powering Autonomous Sensors María Teresa Penella-López, Manuel Gasulla-Forner, 2011-05-18 Autonomous sensors transmit data and power their electronics without using cables. They can be found in e.g. wireless sensor networks WSNs or remote acquisition systems. Although primary batteries provide a simple design for powering autonomous sensors they present several limitations such as limited capacity and power density and difficulty in predicting their condition and state of charge. An alternative is to extract energy from the ambient energy harvesting. However the reduced dimensions of most autonomous sensors lead to a low level of available power from the energy transducer. Thus efficient methods and circuits to manage and gather the energy are a must. An integral approach for powering autonomous sensors by considering both

primary batteries and energy harvesters is presented Two rather different forms of energy harvesting are also dealt with optical or solar and radiofrequency RF Optical energy provides high energy density especially outdoors whereas RF remote powering is possibly the most feasible option for autonomous sensors embedded into the soil or within structures Throughout different chapters devices such as primary and secondary batteries supercapacitors and energy transducers are extensively reviewed Then circuits and methods found in the literature used to efficiently extract and gather the energy are presented Finally new proposals based on the authors own research are analyzed and tested Every chapter is written to be rather independent with each incorporating the relevant literature references Powering Autonomous Sensors is intended for a wide audience working on or interested in the powering of autonomous sensors Researchers and engineers can find a broad introduction to basic topics in this interesting and emerging area as well as further insights on the topics of solar and RF harvesting and of circuits and methods to maximize the power extracted from energy transducers
