What is the relationship between heat energy and temperature?

Purpose: Students actively gain understanding of how mass, temperature, and heat energy, which is proportional to q , are related.

Model 1 – A Hot oil Bath
(Silver Heating)

Model 2 – A Hot oil Bath
(A mass of 10 grams per second)

Consider the graphs specified in Model 1:

1. Suppose substance A and substance B gain some energy, or that both gain the same amount. Explain your reasoning.

2. How can substance A be heated without the temperature increasing or decreasing? Explain your reasoning.

V. Steele, R. D. Chirico, S. E. Knipmeyer, N. K. Smith, 1989 *Theory of Calorimetry* W. Zielenkiewicz, E. Margas, 2006-01-02 Calorimetry is one of the oldest areas of physical chemistry The date on which calorimetry came into being may be taken as 13 June 1783 the day on which Lavoisier and Laplace presented a contribution entitled Memoire de la Chaleur at a session of the Academie Fran aise Throughout the existence of calorimetry many new methods have been developed and the measuring techniques have been improved At p sent numerous laboratories worldwide continue to focus attention on the development and applications of calorimetry and a number of com nies specialize in the production of calorimeters The calorimeter is an instrument that allows heat effects in it to be determined by directly measurement of temperature Accordingly to determine a heat effect it is necessary to establish the relationship tween the heat effect generated and the quantity measured in the ca rimeter It is this relationship that unambiguously determines the mathematical model of the calorimeter Depending on the type of ca rimeter applied the accuracy required and the conditions of heat and mass transfer that prevail in the device the relationship between the measured and generated quantities can assume different mathematical forms *The Modern Calorimeter* Walter Porter White, 1928 **Principles of Thermal Analysis and Calorimetry** Peter J. Heat & Energy David Randall Pye, 1923 **Longitudinal Heat Flow Calorimetry** A. Antriasian, G. Beardsmore, 2014 We present a method for measuring the heat capacity of a rock specimen using a divided bar apparatus in a transient mode The specific heat capacity can be derived if the mass of the specimen is known Thermal conductivity can be measured during a steady state phase of the measurement process and longitudinal thermal diffusivity can also be derived if the specimen volume and hence density is measured A divided bar delivers a longitudinal flow of heat through a rock specimen and is conventionally used only in a steady state mode for thermal conductivity measurements Our method employs a time series record of temperature changes at four points along the divided bar assembly to compare the net thermal energy absorbed by a specimen to its change in temperature during thermal re equilibration from one steady state temperature to another The technique is calibrated using a set of analytical standards of known heat capacity Our method yields mean values of specific heat capacity within 1 % of published values for cultured quartz Repeated measurements on the same specimens also give consistent results within approximately 1 % A combined thermal conductivity and heat capacity measurement takes less than one hour per specimen Our method can be replicated with any divided bar apparatus employing a precise electronic temperature control system capable of switching between two steady state mean temperatures along with a digital data logging system capable of recording and displaying data at a rate of one record per second

Heat Sir Richard Glazebrook, 1904 [The Measurement of Steady and Fluctuating Temperatures](#) Robert Royds, 1921 **Calorimetry in Food Processing** Gönül Kaletunç, 2009-08-06 Calorimetry in Food Processing Analysis and Design of Food Systems introduces the basic principles of calorimetry and highlights various applications of calorimetry to characterize temperature induced changes including starch gelatinization and crystallization lipid transitions protein denaturation and inactivation of microorganisms in a variety of food and biological materials Emphasis is given to the use of calorimetry as a tool for evaluation of processing requirements in order to assess the efficacy of food processing and for characterization of the effects of changes in formulation and processing conditions

Animal and Human Calorimetry J. A. McLean, G. Tobin, 1987 This volume provides a comprehensive survey of the theory practice and techniques of calorimetry as applied to the study of energy metabolism in humans and animals Calorimetry is used to estimate nutritional requirements of man and farm livestock and to evaluate different foods It is also a powerful tool used in research into fundamental nutritional and physiological life processes and in the evaluation of stresses imposed by abnormal or severe environments It is currently

being applied in various branches of medical research and can be used as a diagnostic tool in hospitals for investigation of metabolic disorders. The authors discuss both direct calorimetry which measures heat loss directly and indirect calorimetry where heat loss is inferred by measurement of some of the chemical byproducts of metabolism. In addition, guidance is provided to the instrumentation, technical problems, and precautions necessary to obtain accurate calorimetric measurements.
