

Gene Expression — Transcription

How is mRNA synthesized and what message does it carry?

Why?

DNA is often referred to as a genetic blueprint. In the same way that blueprints contain the instructions for construction of a building, the DNA found inside the nuclei of cells contains the instructions for assembling a living organism. The DNA blueprint carries its instructions in the form of genes. In most cases the genes direct the production of a polypeptide, from which other more complex proteins, such as enzymes or hormones, may be constructed. These polypeptides and other molecules run the organism's metabolism and, in multicellular organisms, dictate what each cell's job is. So, what is the language of these instructions and how are they read and decoded by the cellular organelles? This activity will focus on the decoding of genes in eukaryotes.

Model 1 - Transcription

1. Consider the eukaryotic cell in Model 1.
 - a. Where in the cell is the DNA found?
 - b. Where in the cell does transcription take place?
2. Refer to Model 1.
 - a. What polymer is synthesized during transcription?
 - b. What monomers are used to construct this polymer and where are they found?
3. According to Model 1, what enzyme is required for transcription? (Hint: Think about how enzymes are named. What ending is used for enzyme names?)

In Vitro Transcription and Translation Protocols Martin J. Tymms,2008-02-02 Most laboratories conducting studies that use molecular biology techniques employ in vitro transcription and translation systems as a routine part of their day to day research The commercial availability of purified bacterial RNA polymerase and the availability of robust translation systems has made in vitro systems attractive not only as an alternative to the in vivo expression of genes but also as good model systems for studying specific aspects of transcription and translation Although fairly efficient eukaryotic translation systems have been established for a number of years reconstitution of transcription in vitro has proved to be more difficult Recent improvements in fractionation techniques and the cloning of proteins involved in transcription have made this a fast moving area of research Considerable progress has also been made in recent years in developing in vitro systems to study transcription and translation in chloroplasts and mitochondria together with systems for the study of protein import *In Vitro Transcription and Translation Protocols* provides many detailed experimental procedures for prokaryotic transcription and translation systems together with protocols for many key techniques used in the analysis of eukaryotic transcription In keeping with the successful format of preceding volumes of the *Methods in Molecular Biology* series step by step instructions are provided together with extensive notes that cover troubleshooting and special tips considered important

sequence the human genome is now moving toward a conclusion As all of the protein coding sequences are described an increasing emphasis will be placed on understanding gene function and regulation One important aspect of this analysis is the study of how transcription factors regulate transcriptional initiation by RNA polymerase II which is responsible for transcribing nuclear genes encoding messenger RNAs The initiation of Class II transcription is dependent upon transcription factors binding to DNA elements that include the core or basal promoter elements proximal promoter elements and distal enhancer elements General initiation factors are involved in positioning RNA polymerase II on the core promoter but the complex interaction of these proteins and transcriptional activators binding to DNA elements outside the core promoter regulate the rate of transcriptional initiation This initiation process appears to be a crucial step in the modulation of mRNA levels in response to developmental and environmental signals Transcription Factor Protocols provides step by step procedures for key techniques that have been developed to study DNA sequences and the protein factors that regulate the transcription of protein encoding genes This volume is aimed at providing researchers in the field with the well detailed protocols that have been the hallmark of previous volumes of the Methods in Molecular Biology series
