

A script is executed, `obdbuild.sh`, that will parse the command line arguments and read the runtime libraries. After the check on the syntax the project file of `ant`, `build.xml`, is called via `java` and `Ant` runtime libraries with the supplied arguments. The `ant` project file will execute the specific task. The web interface, based on a Perl script, will collect the arguments from the HTTP request and transform those into a command line argument. So the Perl script calls the `obdbuild.sh` script.

The shell script is used to verify the syntax of the command line parameters. It should provide initial feedback if the syntax is not correct. It should also provide help information on the usage of the tool. Initially the tool is written for Unix like operating system using the Bourne shell. The following functions should be executed in the shell script:

- a Read environment settings to execute Java and ANT
- b Shows help information
- c Show the version of CMake
