

Tropism:

Tropism is the growth (or turning movement) of a plant or part of a plant in response to an external (environmental) stimulus.

Phototropism:

Phototropism is the growth of a plant in the direction of a light source.

Geotropism:

Geotropism is the growth of a plant in response to gravity.

RESPONDING TO THE ENVIRONMENT: PLANTS

Role of Auxins in Phototropism: STEM

- Produced at the tip of stem/shoot
- Auxins move downwards evenly
- The even distribution brings about equal growth on all sides of the stem
- As a result the stem grows upward

Describe what happens when the stem receives unilateral light.

- The auxin concentration will be high on the dark side - light stimulates auxin
- More growth occurs on the dark side because auxin stimulates growth on the dark side
- As a result, the stem bends towards the light

Describe the use of hormones in farming industry:

Auxins

Auxin-based herbicides are used to destroy weeds.
Auxins stimulate root development from cuttings.

Gibberellins

Gibberellins promote growth, which increases yield, e.g. in grapes.
Gibberellins increase the development of buds, flowers and fruit.

Describe the control of growth using plant hormones:

-
-

Role of Auxins in Geotropism: ROOT

- Produced at the tip of roots
- Auxins move upwards evenly
- The even distribution brings about equal growth on all sides of the root
- As a result the root grows downward

Describe what happens when the root is placed horizontally.

- The auxin concentration will be high on the lower side of the root - gravity stimulates auxin
- More growth occurs on the upper side of the root because auxin on the lower side inhibits growth
- As a result the root bends downwards

Describe the role of Ethylene Acid

Ethylene growth of roots promotes and increases distribution of growth. High water growth of root stimulates growth of buds.

1. Which type of tropism is illustrated above?
Geotropism / Gravitropism

1.2 Explain the advantage that the upward bending of the stem could have for the plant.

Stems will be exposed to maximum sunlight for photosynthesis. Exposed flowers more favourable for pollination / seed dispersal.

The diagrams below shows two plants at the start of an investigation

- The diagrams were made to start 1.
- The seedling in plant B was tilted.
- Both plants were covered with a box with a single opening, as shown in the diagram, and placed in a dark room.

2.1 Name the growth movement investigated. **Phototropism**

2.2 Tabulate THREE differences between plants A and B you would expect after two weeks.

Plant A	Plant B
Stem will be upright	Stem will be tilted to the right
Roots will be horizontal	Roots will be tilted to the left
Leaves will be horizontal	Leaves will be tilted to the right

2.3 Plant B was later upright with gibberellins. Explain the effect gibberellins would have on plant B.

Gibberellins causes the plant to grow taller, as gibberellins promotes elongation / growth of the internodes.

3. Explain why it is not advisable to use auxin-based herbicides on bean plants, which are dicotyledonous.

It would kill the beans, thus reducing the yield. Auxin-based herbicides kill dicotyledonous weeds / plants.

4. Name the phenomenon where buds at the tip of the plant regulates the growth of lateral buds. **Apical dominance**

5. Draw a labelled diagram to show the position of the plumule and the radicle of the seedling after one week.
