atmosphere land space earth and planets *The State of the Art in Student Engagement* Carl Senior, 2015-07-10 There is an extensive literature conducted from a range of theoretical perspectives and methodologies on the role of groups and student learning in higher education However here the concept of the group is heavily contested at a theoretical level but within higher education practice characterizing the group has tended to be clear cut Groups of students are often formed within the parameters of specific educational programs to address explicitly defined learning objectives These groups are often small scale and achieve tasks through cooperative or collaborative learning Cooperative learning involves students dividing roles and responsibilities between group members so learning becomes an independent process and outcome On the other hand collaborative learning involves students working together by developing shared meanings and knowledge to solve a task or problem From this perspective learning is conceptualized as both a social process and individual outcome That is collaborative learning may facilitate individual student conceptual understanding and hence lead to higher academic achievement The empirical evidence is encouraging as has been shown that students working collaboratively tend to achieve higher grades than students working independently However the above perspectives on student engagement assume that groups are formed within the confines of formal learning environments e g lecture theaters involve students on the same degree program have the explicit function of achieving a learning task and disband once this has been achieved However students may also use existing social networks such as friendship groups as a mechanism for learning which may occur outside of formal learning environments There is an extensive literature on the role and benefits of friendship groups on student learning within primary and secondary education but there is a distinct lack of research within higher education This ebook is innovative and ambitious and will highlight and consolidate the current understanding of the role that student based engagement behaviors may serve in effective pedagogy A unique aspect of this research topic will be the fact that scholars will also be welcome to submit articles that describe the efficacy of the full range of approaches that have been employed to facilitate student engagement across the sector

How We Teach Science John L. Rudolph, 2019-06-01 A former Wisconsin high school science teacher makes the case that how and why we teach science matters especially now that its legitimacy is under attack Why teach science The answer to that question will determine how it is taught Yet despite the enduring belief in this country that science should be taught there has been no enduring consensus about how or why This is especially true when it comes to teaching scientific process Nearly all of the basic knowledge we have about the world is rock solid The science we teach in high schools in particular laws of motion the structure of the atom cell division DNA replication the universal speed limit of light is accepted as the way nature works Everyone also agrees that students and the public more generally should understand the methods used to gain this knowledge But what exactly is the scientific method Ever since the late 1800s scientists and science educators have grappled with that question Through the years they've advanced an assortment of strategies ranging from the laboratory method to the five step method to science as inquiry to no method at all *How We Teach Science* reveals that each strategy was influenced by the intellectual cultural and political circumstances of the time In some eras learning about experimentation and scientific inquiry was seen to contribute to an individual's intellectual and moral improvement while in others it was viewed as a way to minimize public interference in institutional science John Rudolph shows that how we think about and teach science will either sustain or thwart future innovation and ultimately determine how science is perceived and received by the public

The Case against Education Bryan Caplan, 2018-01-30 Why we need to stop wasting public funds on education Despite being immensely popular and immensely lucrative education is grossly overrated In this explosive book Bryan Caplan argues that the primary function of education is not to enhance students skill but to certify their intelligence work ethic and conformity in other words to signal the qualities of a good employee Learn why students hunt for easy As and casually forget most of what they learn after the final exam why decades of growing access to education have not resulted in better jobs for the average worker but instead in runaway credential inflation how employers reward workers for costly schooling they rarely if ever use and why cutting education spending is the best remedy Caplan draws on the latest social science to show how the labor market values grades over knowledge and why the more education your rivals have the more you need to impress employers He explains why graduation is our society's top conformity signal and why even the most useless degrees can certify employability He advocates two major policy responses The first is educational austerity Government needs to sharply cut education funding to curb this wasteful rat race The second is more vocational education because practical skills are more socially valuable than teaching students how to outshine their peers Romantic notions about education being good for the soul must yield to careful research and common sense The Case against Education points the way
