

Photosynthesis

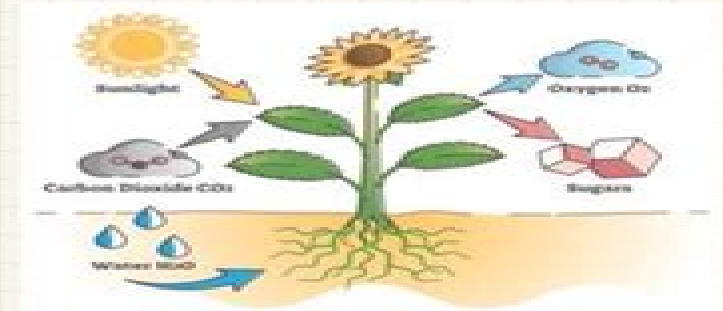

The equation for **photosynthesis** is $6\text{CO}_2 + 6\text{H}_2\text{O} \rightarrow \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2$

Photosynthesis is the process where plants transform **light energy** into **chemical energy**. Plants use this energy to make their own food. The light energy they captured is used to convert **carbon dioxide**, water and minerals into oxygen.

Chlorophyll → The pigment that gives the plants their green colour and helps in the process of photosynthesis by **absorbing** the light.

Chloroplasts → The plant cell **structure** where photosynthesis occurs. They are found in the palisade cells in the leaves.

Xylem → The **plant vascular tissue** that moves water and dissolved minerals **upwards** towards the rest of the plant and also provides physical support. The water-conducting function is essential for photosynthesis.

The photosynthesis process

- Plants take in water and carbon dioxide and use energy from the sun to turn them into food.
- Within the plant cell, water is oxidised, loses **electrons** and is changed into **oxygen**. Carbon dioxide is reduced, gains electrons and turns into glucose.
- Oxygen is released, and **glucose** is stored within the plant as energy.

Photosynthesis is an **endothermic reaction**. This means it cannot occur without energy (from the Sun).

To perform photosynthesis you must have a source of light, water and CO_2

Fun fact:

There are **organisms** other than plants that can go through photosynthesis. These include algae and the emerald green sea slug.

Non-Target Effects of Pesticides on Organisms Inhabiting Agroecosystems Johann G. Zaller, Carsten A. Brühl, 2019-10-17 Pesticide usage is increasing worldwide and considered among the main factors contributing to the global decline in biodiversity This Research Topic provides an overview of the state of knowledge regarding non target effects of herbicides fungicides insecticides and rodenticides on a variety of ecosystem functions and organisms Taxa covered in the contributions include algae amphibians aquatic fungi aquatic insects bats bumblebees butterflies earthworms enchytraeids honeybees plants rodents and soil microorganisms The papers also highlight many gaps in our understanding of non target effects of pesticides and their consequences for biodiversity and functions of various ecosystems Overall it became clear that priorities for future work on pesticides and their effects should more focus on investigating or simulating realistic field situations i e multiple applications of pesticides during the growing season including their temporal and spatial interactions with fauna and flora

Phytoplankton Whispering: An Introduction to the Physiology and Ecology of Microalgae Patricia M. Glibert, 2024-08-12 Phytoplankton or algae are the engines of the Earth They form the base of the aquatic food web and although microscopic they produce 50% of the oxygen in the air Many of our ideas of what makes these cells tick come from ideas developed decades ago But lakes and oceans are changing and so too are phytoplankton Our understanding has to change accordingly Nutrient pollution is a major problem worldwide and climate is changing altering temperature CO₂ and pH as well as the physics that control water stratification All of these factors control which species of phytoplankton may grow well at any particular time While algae grow in all types of aquatic systems not all algae are favorable for the production of fish and other food resources The prevalence of harmful algal blooms HABs has increased At the core of this effort is a drive to understand and to convey to researchers students and managers what kinds of phytoplankton are likely to thrive as conditions change and why this matters There has not yet been a synthetic summary that unravels the mysteries of phytoplankton in a modern world This book aims to provide such a resource

Plant Ecophysiology: Responses to Climate Changes and Stress Conditions Srdjan Stojnic, Nacer Bellaloui, Raul Antonio Sperotto, Yanbo Hu, Georgios Koubouris, Peter Petřík, 2025-10-23 Climate change characterized by amplified frequency and amplitude of heat waves increased evaporative demand and altered precipitation patterns threatening the productivity and stability of ecosystems worldwide Previous research identified a number of abiotic

and biotic stressors that affects plant physiology and contributes to natural ecosystems decline as well as crop yield failure Depending on their intensity and duration plant species may display a wide range of strategies and mechanisms to withstand environmental stress including physiological and biochemical responses as well as modulation in structural characteristics such as anatomy and morphology However despite the great progress made in understanding plant responses and tolerance to environmental stress factors a holistic and systematic knowledge on the effect of multiple simultaneous and or sequential stress factors and their interactions is still lacking In addition climate change imposes the alteration of a series of environmental factors simultaneously as well as intensify the severity of different stressful events such as drought floods salinity and heat waves Therefore knowledge of how plants acclimate to multiple stressors is critical in understanding the effects of future climates on natural ecosystems urban greenery and agroforestry systems i e tree crops interaction worldwide *Remote Sensing of Aquatic Coastal Ecosystem Processes* Laurie L.
