11. *Explain the importance of the following factors in the design of a research study:*
 12. *Sampling method, sample size, and control group.*
 13. *Identify the strengths and weaknesses of each method.*

Abstract The purpose of this study was to determine the effect of a 12-week, 30-min, 3 times per week, low-impact aerobically and resistance training program on the physical fitness of sedentary, middle-aged women. The study was a randomized, controlled trial. The subjects were randomly assigned to either an exercise group or a control group. The exercise group performed a 12-week, 30-min, 3 times per week, low-impact aerobically and resistance training program. The control group performed no exercise. The physical fitness of the subjects was measured at baseline and at 12 weeks. The results of the study showed that the exercise group had significantly higher levels of physical fitness than the control group at 12 weeks. The results also showed that the exercise group had significantly higher levels of physical fitness than the control group at baseline. The results of the study suggest that a 12-week, 30-min, 3 times per week, low-impact aerobically and resistance training program can improve the physical fitness of sedentary, middle-aged women.

Students were invited to participate in this research. The research was approved by the ethics committee of the University of the West of England.
