A coefficient is a number placed in front of a chemical formula to indicate the number of molecules of that substance that are involved in the reaction. It is used to balance the equation.

What is a chemical reaction? A chemical reaction is a process in which one or more substances are converted into one or more different substances. The substances that enter the reaction are called reactants, and the substances that are produced are called products.

What is a chemical equation? A chemical equation is a symbolic representation of a chemical reaction. It shows the reactants on the left, the products on the right, and the coefficients that balance the equation.

What is a chemical formula? A chemical formula is a symbolic representation of a chemical compound. It shows the elements that make up the compound and the number of atoms of each element.

Bonding and Chemical Reactions - KEY

C. READING

1. Why do atoms bond together?
 - Atoms bond together to achieve a more stable electronic configuration, typically by filling or emptying their valence electron shells to satisfy the octet rule.
2. What is a covalent bond?
 - A covalent bond is a type of chemical bond formed between two atoms by the sharing of electron pairs, resulting in the formation of a molecule. It is the most common type of bond in organic chemistry.
3. What kind of electrons form covalent bonds?
 - Valence electrons, which are the outermost electrons of an atom, form covalent bonds by being shared between two atoms.
4. What is an ionic bond?
 - An ionic bond is a type of chemical bond formed between two atoms by the transfer of one or more electrons from one atom to another, resulting in the formation of oppositely charged ions that are held together by electrostatic attraction.
5. What kind of electrons form ionic bonds?
 - Valence electrons, which are the outermost electrons of an atom, form ionic bonds by being transferred from one atom to another, resulting in the formation of oppositely charged ions.
6. Why don't noble gases combine with other elements?
 - Noble gases have a full valence shell, which makes them chemically stable and unreactive with other elements.
7. Why do ionic compounds form crystalline solids?
 - Ionic compounds form crystalline solids because the strong electrostatic forces between the oppositely charged ions hold them together in a regular, repeating pattern.
8. What is a chemical reaction?
 - A chemical reaction is a process in which one or more substances are converted into one or more different substances. The substances that enter the reaction are called reactants, and the substances that are produced are called products.
