Polymerase Chain Reaction

Synopsis

In this Polymerase Chain Reaction (PCR) simulation, you will see through eight easy-to-understand scenes how to introduce DNA target, primer, to investigate the target, amplify and finally how to perform electrophoresis to find that the target sequence has been amplified.

Design and

After sampling, you will go to the PCR laboratory to investigate the sample of DNA you collected. By using a mixture of thermocycling, you can amplify the target DNA. After PCR, you will find that target sequence exponentially has been amplified.

How the structure of DNA can be explained as follows:

In the simulation, you will find that DNA supercoiled on the chromosome. Later, illustrating the structure of DNA and the replication cycle including all the steps involved throughout the experimental process, as well as all specifications of the PCR itself.

Identify the materials

In the first simulation, you will collect your sample and other material samples from the laboratory and add them together. The polymerase can change DNA into the other structure that structure.

Learning Objectives

In the last of this simulation, you will see reports:

1. Results the function of your polymerase, primer, template and product.
2. Report is this simulation using this, from a data source on the following:
