**Abstract**—The purpose of this study was to determine the effect of a 12-week training program on the heart rate (HR) and heart rate reserve (HRR) of sedentary middle-aged men. The subjects were divided into two groups: a control group and an exercise group. The exercise group performed a 12-week training program consisting of three sessions per week of aerobic exercise. The control group did not exercise. The HR and HRR were measured at rest and during exercise at the beginning and end of the 12-week period. The results showed that the exercise group had a significant decrease in HR and HRR at rest and during exercise compared to the control group. The control group had no significant change in HR and HRR. The results suggest that a 12-week training program can improve the cardiovascular fitness of sedentary middle-aged men.

- Day and night periods that are longer than the standard 24 hours occur most commonly with the use of artificial light or other light sources. To avoid this, there are two things the producer should do:
  - 1. Turn off the lights at the end of the day.
  - 2. Avoid excessive light intensity, the length of the day and the light spectrum. For the best results, use fluorescent, not incandescent, lighting. The light should be kept at least 12 inches from the plants. In addition, the lighting should be kept at a level that is just below the threshold of discomfort for the fish (about 100 foot-candles).

When you install your T-Value One Connection, improper installation of all four screws (50 combinations for One Connection) will void the warranty. Please, before installing, refer to the correct installation instructions. Failure to maintain proper ventilation may result in a serious problem with the product.

- When a producer's price for the output rises or falls, it must adjust its output level accordingly. For example, if the price of the output rises, the producer will want to produce more of the output, and if the price falls, the producer will want to produce less of the output.

**Caution:** Spilling, pouring, or collecting water from a Tivvy cooler than 100°F (40°C) is just below the minimum temperature the mold needs to grow. In order to develop the *Trichoderma reesei* mycelium, the Tivvy cooler must be kept between 100°F and 110°F (40°C and 43°C) for 10 to 14 days. To ensure the mold grows, you must keep the Tivvy cooler at a steady temperature. To do this, you can place the Tivvy cooler in a warm area, such as a sunny window or near a heat source, and use a thermometer to monitor the temperature. If the temperature is too low, you can use a space heater to warm the area. If the temperature is too high, you can use a fan to cool the area. The Tivvy cooler should be kept at a steady temperature of 100°F to 110°F (40°C to 43°C) for 10 to 14 days.
