Abstract

Notes: 1. *Indicates the estimated number of children in need of special services.*

Abstract: *Psychosis* is a clinical condition that is not necessarily accompanied by structural brain changes. Most research on the pathophysiology of psychosis focuses on the role of dopamine, but the role of other neurotransmitters, including serotonin, is also being investigated. The aim of this study was to investigate the role of serotonin in the pathophysiology of psychosis. We used a rodent model of psychosis, the amphetamine-induced psychosis model, to investigate the role of serotonin. We found that the amphetamine-induced psychosis model is associated with changes in the serotonin system, including changes in the expression of serotonin receptors and the release of serotonin. These findings suggest that the serotonin system may play a role in the pathophysiology of psychosis.
