

Production of Supercoiled DNA during Replication

Figure 10.10: Production of Supercoiled DNA during Replication

When the DNA double helix is overwound, it becomes strained. This strain is relieved by the action of topoisomerase, which makes a temporary break in the DNA molecule, allowing it to rotate and then reseal the break. The action of topoisomerase is essential for the progression of DNA replication. The DNA molecule shown on the right is a supercoiled DNA molecule, which is a compact form of DNA that is more stable than the relaxed form.
