**Freeze-Drying of Pharmaceutical and Food Products** Tse-Chao Hua, Bao-Lin Liu, Haimei Zhang, 2010-07-30 Freeze drying is an important preservation technique for heat sensitive pharmaceuticals and foods. Products are first frozen then dried in a vacuum at low temperature by sublimation and desorption rather than by the application of heat. The resulting items can be stored at room temperature for long periods. This informative text addresses both principles and practice in this area. The first chapter introduces freeze drying. The authors then review the fundamentals of the technique: heat mass transfer, analyses, modelling of the drying process and the equipment employed. Further chapters focus on freeze drying of food, freeze drying of pharmaceuticals and the protective agents and additives applied. The final chapter covers the important subjects of disinfection, sterilization and process validation. Freeze drying of pharmaceutical and food products is an essential reference for food, pharmaceutical and refrigeration engineers and scientists with an interest in preservation techniques. It will also be of use to students in these fields. Addresses the principles and practices used in this important preservation technique. Explains the fundamentals of heat mass transfer analysis, modelling and the equipment used. Discusses the importance of disinfection, sterilization and process validation. Structure-Property Relationships of Polymeric Solids Anne Hiltner, 2012-12-06 This book contains a collection of original research papers which were presented in honor of the Bordon Award recipient Professor Eric Baer on the occasion of the 55th Meeting of the American Chemical Society, Atlanta, Georgia, March 1981. The contributors are present or former colleagues and students who have worked with him in the Department of Macromolecular Science at Case Institute of Technology of Case Western Reserve University. Throughout his work, Eric Baer has attempted to find the relationships of solid state structure and hierarchy to the resultant properties from which specific functions are derived. Although he has studied many seemingly unrelated subjects from irreversible deformation mechanics and yield processes in amorphous polymeric solids to structural organization and mechanical function of tendon, his unique goal has been to develop models from the real structure that would allow a quantitative description of properties. Today this area of microscience is rapidly expanding as new and sophisticated applications of polymeric materials with multifunctional properties are emerging from our understanding and control of the solid state. The wide ranging ideas and the originality of Professor Baer's contributions have stimulated many new concepts which are now widely accepted in the field of high polymers. The contributions to this volume represent many of the areas which he has explored. *A Guide to Materials Characterization and Chemical Analysis* John P. Sibiak, 1988 Handbook of Differential Scanning Calorimetry Joseph D. Menczel, Janusz Grebowicz, 2023-02-22 Differential scanning calorimetry (DSC) is the most important thermal analysis technique used today and the most common thermal analysis instrument found in chemical characterization laboratories. DSC has become an everyday tool in characterization laboratories but many researchers using this technique have a limited understanding of the true breadth of its capabilities. Up to now there has been no book that would describe the application of

DSC in all the various areas of materials chemistry The Handbook of Differential Scanning Calorimetry has been written to fill that void This book is designed to summarize the knowledge of differential scanning calorimetry so that materials researchers and application chemists are given both a better understanding of techniques as well as a review of the full scope of its capabilities It also discusses how to properly interpret the DSC thermograms data obtained Included in this work is the most up to date information written by some of the leaders in the field It is written not only to help users get the most out of their equipment After reading this book people in all chemical and biological areas will have a broad overview of this measuring technique and will be able to utilize this analytical technique more efficiently Provides a detail description of the theory behind differential scanning while simultaneously providing a wider breadth of understanding of the actual DSC technique Includes a review of the basics of heat flux and power compensation DSC s as well as separate chapters on inorganic and organic materials Reviews the most common commercial DSC instruments on the market and their uses including TA Instruments Perkin Elmer Hitachi Mettler Toledo Netzsch and Setaram

*Latent Heat-Based Thermal Energy Storage Systems* Amritanshu Shukla, Atul Sharma, Pascal Henry Biwolé, 2020-09-27 In light of increasing human induced global climate change there is a greater need for clean energy resources and zero carbon projects This new volume offers up to date coverage of the fundamentals as well as recent advancements in energy efficient thermal energy storage materials their characterization and technological applications Thermal energy storage TES systems offer very high energy savings for many of our day to day applications and could be a strong component for enhancing the usage of renewable clean energy based devices Because of its beneficial environmental impact this technology has received wide attention in the recent past and dedicated research efforts have led to the development of novel materials as well to innovative applications in very many fields ranging from buildings to textile healthcare to agriculture space to automobiles This book offers a valuable and informed systematic treatment of latent heat based thermal energy storage systems covering current energy research and important developmental work

*Food Structure* J. M. V. Blanshard, J. R. Mitchell, 2016-07-29 Food Structure Its Creation and Evaluation reviews research and major developments with regard to the role of ingredients in building food structures Emphasis is on homogeneous and heterogeneous multicomponent systems their molecular interactions the macroscopic physics of their mechanical properties and the variety of techniques and strategies necessary to evaluate their properties if they are to be acceptable to the consumer This book is comprised of 26 chapters and begins by discussing the relevance of food structure from a dental clinical perspective The next chapter describes a hierarchy of gel structures that may be used to model the complex molecular networks formed by the protein and or polysaccharide components within the food system including simple single component networks binary networks or mixed gels and composite or filled gels The reader is then introduced to the gel structure of food biopolymers the structure and stability of emulsions the polymer water relationship and its importance for food structure and the fracture properties of polymers Dry spinning of milk proteins is also considered

Ma,2013-04-17 Since the dawn of civilization mankind has been engaged in the conception and manufacture of discrete products to serve the functional needs of local customers and the tools technology needed by other craftsmen In fact much of the progress in civilization can be attributed to progress in discrete product manufacture The functionality of a discrete object depends on two entities form and material composition For instance the aesthetic appearance of a sculpture depends upon its form whereas its durability depends upon the material composition An ideal manufacturing process is one that is able to automatically generate any form freeform in any material However unfortunately most traditional manufacturing processes are severely constrained on all these counts There are three basic ways of creating form conservative subtractive and additive In the first approach we take a material and apply the needed forces to deform it to the required shape without either adding or removing material i e we conserve material Many industrial processes such as forging casting sheet metal forming and extrusion emulate this approach A problem with many of these approaches is that they focus on form generation without explicitly providing any means for controlling material composition In fact even form is not created directly They merely duplicate the external form embedded in external tooling such as dies and molds and the internal form embedded in cores etc Till recently we have had to resort to the subtractive approach to create the form of the tooling      **Assignment of the Glass Transition** Rickey J.
