Variation and Gradience in Phonetics and Phonology Frank Kügler, Caroline Féry, Ruben Vijver, 2009-08-17 This book provides an overview of current issues in variation and gradience in phonetics phonology and sociolinguistics It contributes to the growing interest in gradience and variation in theoretical phonology by combining research on the factors underlying variability and systematic quantitative results with theoretical phonological considerations Variation is inherent to language and one of the aims of phonological theory is to describe and explain the mechanisms underlying variation at every level of phonological representation Variation below the segment concerns articulatory acoustic and perceptual cues that contribute to the formation of natural classes of sounds At the segmental level there are grammatical differences in the production and perception of contextual variation of segments and in the syntagmatic constraints on the combination of segments At the suprasegmental level the mapping of tones to grammatical functions and vice versa is discussed Further aspects addressed in this book are factors outside of language Variation that arises as a result of a particular dialect or of belonging to a certain age group or variation that is the consequence of language change Gradience and variation have always been a central issue in phonetic and sociolinguistic research Gradience introduces variation in phonology as well If a phonetic entity can be pronounced in different ways depending on the environment prosodic factors or dialectal influences this gradience may introduce variation which we understand as a stable state of grammar

Production, perception, and comprehension of subphonemic detail: Word-Final /s/ in English Dominic Schmitz, 2022-11-22 The complexities of speech production perception and comprehension are enormous Theoretical approaches of these complexities most recently face the challenge of accounting for findings on subphonemic differences The aim of the present dissertation is to establish a robust foundation of findings on such subphonemic differences One rather popular case for differences in subphonemic detail is word final s and z in English henceforth S as it constitutes a number of morphological functions Using word final S three general issues are investigated First are there subphonemic durational differences between different types of word final S If there are such differences how can they be accounted for Second can such subphonemic durational differences be perceived Third do such subphonemic durational differences influence the comprehension of S These questions are investigated by five highly controlled studies a production task an implementation of Linear Discriminative Learning a same different task and two number decision tasks Using not only real words but also pseudowords as target items potentially confounding effects of lexical storage are controlled for Concerning the first issue the results show that there are indeed durational differences between different types of word final S Non morphemic S is longest in duration clitic S is shortest in duration and plural S

duration is in between non morphemic S and clitic S durations It appears that the durational differences are connected to a word s semantic activation diversity and its phonological certainty Regarding the second issue subphonemic durational differences in word final S can be perceived with higher levels of perceptibility for differences of 35 ms and higher In regard to the third issue subphonemic durational differences are found not to influence the speed of comprehension but show a significant effect on the process of comprehension The overall results give raise to a revision of various extant models of speech production perception and comprehension
