Thermochronological Methods Frank Lisker, Barbara Ventura, U. A. Glasmacher, 2009 Thermochronology the use of temperature sensitive radiometric dating methods to reconstruct the thermal histories of rocks has proved to be an important means of constraining a wide variety of geological processes Fission track and U Th He analyses of apatites zircons and titanites are the best established methods for reconstructing such histories over time scales of millions to hundreds of millions of years The papers published in this volume are divided into two sections The first section on New approaches in thermochronology presents the most recent advances of existing thermochronological methods and demonstrates the progress in the development of alternative thermochronometers and modelling techniques The second section Applied thermochronology comprises original papers about denudation long term landscape evolution and detrital sources from the European Alps northwestern Spain the Ardennes the Bohemian Massif Fennoscandia and Corsica It also includes case studies from the Siberian Altai Mozambique South Africa and Dronning Maud Land East Antarctica and reports an ancient thermal anomaly within a regional fault in Japan *Thomas Register of American Manufacturers*, 2002 This basic source for identification of U S manufacturers is arranged by product in a large multi volume set Includes Products services Company profiles and Catalog file

Fatigue of Heavy-Vehicle Engine Materials Viktor Norman, 2018-02-13 Due to increasing demands on sustainability exerted by end customers and policy makers heavy vehicle manufacturers are urged to increase the engine efficiency in order to reduce the exhaust gas emission However increasing the efficiency is also associated with an elevated fatigue rate of the materials constituting the engine parts which consequently reduces the engine service life The aim of the present thesis is therefore to confront the expected increase by studying the fatigue behaviour and damage mechanisms of the materials typically employed in heavy vehicle diesel engines With this knowledge this work seeks to guide the development of new heavy vehicle engine materials as well as to develop improved life estimation methods designated to assist the mechanical design of durable heavy vehicle engines In essence a large set of thermo mechanical fatigue TMF and combined thermomechanical and high cycle fatigue TMF HCF tests is conducted at engine load conditions on laboratory specimens of lamellar compacted and spheroidal graphite iron In this way the fatigue performance and associated damage mechanisms are investigated In particular a new fatigue property is identified the TMF HCF threshold which quantifies how resistant a material is to superimposed high cycle fatigue The damage mechanism at low temperatures 500 C is confirmed to consist of the initiation propagation and coalescence of numerous microcracks Based on this a successful fatigue life estimation model is formulated allowing accurate estimations of TMF and TMF HCF tests on smooth specimens and TMF tests on notched specimens In the latter case the microcrack growth behaviour in non uniform cyclic stress fields and its implications for life estimation are clarified At elevated temperatures 500 C surface oxidation is shown to govern the fatigue performance of cast iron grades intended for exhaust manifolds It is observed that oxide intrusions are induced from which

surface fatigue cracks are initiated Consequently an optimal material at these conditions should have a low oxide growth rate and few casting defects at the surface as these factors are found to stimulate the growth of intrusion **Thomas Register of American Manufacturers and Thomas Register Catalog File** ,2002 Vols for 1970 71 includes manufacturers catalogs
