Ultra-Wideband and 60 GHz Communications for Biomedical Applications Mehmet R. Yuce, 2013-10-16 This book investigates the design of devices systems and circuits for medical applications using the two recently established frequency bands ultra wideband 3.1-10.6 GHz and 60 GHz ISM band These two bands provide the largest bandwidths available for communication technologies and present many attractive opportunities for medical applications The applications of these bands in healthcare are wireless body area network WBAN medical imaging biomedical sensing wearable and implantable devices fast medical device connectivity video data transmission and vital signs monitoring The recent technological advances and developments proposed or used in medicine based on these two bands are covered The book introduces possible solutions and design techniques to efficiently implement these systems in medical environment All individual chapters are written by leading

experts in their fields Contributions by authors are on various applications of ultra wideband and the 60 GHz ISM band including circuit implementation UWB and 60 GHz signal transmission around and in body antenna design solution hardware implementation of body sensors UWB transceiver design 60 GHz transceiver design UWB radar for contactless respiratory monitoring and ultra wideband based medical Imaging The book will be a key resource for medical professionals bio medical engineers and graduate and senior undergraduate students in computer electrical electronic and biomedical engineering disciplines

Radio-electronics, 1987 **Low Power VCO Design in CMOS** Marc Tiebout, 2006-01-25 This work covers the design of CMOS fully integrated low power low phase noise voltage controlled oscillators for telecommunication or datacommunication systems The need for low power is obvious as mobile wireless telecommunications are battery operated As wireless telecommunication systems use oscillators in frequency synthesizers for frequency translation the selectivity and signal to noise ratio of receivers and transmitters depend heavily on the low phase noise performance of the implemented oscillators Datacommunication systems need low jitter the time domain equivalent of low phase noise clocks for data detection and recovery The power consumption is less critical The need for multi band and multi mode systems pushes the high integration of telecommunication systems This is offered by sub micron CMOS featuring digital exibility The recent crisis in telecommunication clearly shows that mobile hand sets became mass market high volume consumer products where low cost is of prime importance This need for low cost products livens tremendously research towards CMOS alternatives for the bipolar or BiCMOS solutions in use today
