

Phylogenetic Trees

How do the changes in gene sequences allow us to reconstruct the evolutionary relationships between related species?

Why?

The saying "Don't judge a book by its cover," could be applied to the topic of evolution. For example, humans share 75% of their DNA with chickens. Biologists point to this as evidence that humans and chickens once shared a common ancestor. The advent of DNA technology has given scientists the tools with which to examine how closely related certain species are. DNA analysis allows scientists to construct phylogenetic trees whose branches link together the relatedness of different organisms.

Model 1 – Phylogenetic Trees

1. Refer to Model 1.
 - a. How long ago did the common ancestor of all the organisms on this phylogenetic tree exist?
35 mil.
 - b. Which two lines diverged 30 million years ago?
bear and panda
 - c. List all modern descendants of the organism that was alive at the point indicated by the asterisk.
every thing except
black and polar

Phylogenetic Trees and Molecular Evolution David R. Bickel, 2022 This book serves as a brief introduction to phylogenetic trees and molecular evolution for biologists and biology students It does so by presenting the main concepts in a variety of ways first visually then in a history next in a dice game and finally in simple equations The content is primarily designed to introduce upper level undergraduate and graduate students of biology to phylogenetic tree reconstruction and the underlying models of molecular evolution A unique feature also of interest to experienced researchers is the emphasis on simple ways to quantify the uncertainty in the results more fully than is possible with standard methods

Branching Out Amelie Sophia el Mahmoud, 2025 Creating phylogenetic trees to describe evolution is an ongoing project in biology In 1987 two independent papers introduced a new technique used to construct phylogenetic trees called the method of phylogenetic invariants Phylogenetic invariants are polynomials in the joint distributions arising from a Markov process on a tree Since they were introduced much work has been done to calculate phylogenetic invariants for certain classes of models In this thesis we introduce the algebraic geometric concepts underlying the computations of these invariants We also provide a biological understanding of evolution how it is represented through trees and the assumptions we make to simplify our model Finally we describe the model used to calculate phylogenetic invariants and unpack the work
