

Neuron Structure

What are the essential structures that make up a neuron?

Why?

Cells are specialized for different functions in multicellular organisms. In animals, one unique kind of cell helps organisms survive by collecting information and sending messages throughout the body. The shapes and features of neurons, which are the primary cells in the nervous system, enable animals to experience all of the five senses; find food, mates, and shelter; and to survive in their diverse environments.

Model 1 – Parts of a Neuron

1. Model 1 is an illustration of two neurons. Label one of the neurons in the diagram with the following structures:

Cell body or soma

Axon

Cell nucleus

Synapse

Dendrites

See Model 1.

2. Which structure(s) on the neuron in Model 1 would receive a signal from either a sensory cell (taste bud, touch receptor, retinal cell) or from another neuron?

The dendrites receive the signal from other cells.

3. Draw an arrow through the two cells in Model 1 to show the path of a nerve impulse if a message was being sent through the two neurons.

See dotted line in Model 1.

I. Poljakov, 1972 **Neuron Structure-function Correspondence as Revealed by Biological Scaling Theory** Paheli Desai-Chowdhry, 2023

Neurons are connected by complex branching processes that collectively process information for organisms to respond to their environment. Classifying neurons according to differences in structure or function is a fundamental piece of neuroscience. Here, by constructing new biophysical theory and testing against our empirical measures of branching structure, we establish a correspondence between neuron structure and function as mediated by principles such as time or power minimization for information processing as well as spatial constraints for forming connections. Based on these principles, we use Lagrange multipliers to predict scaling ratios for axon and dendrite sizes across branching levels. We test our predictions for radius scale factors against those extracted from images measured for species that range from insects to whales. Notably, our findings reveal that the branching of axons and peripheral nervous system neurons is mainly determined by time minimization, while dendritic branching is mainly determined by power minimization. Further comparison of different dendritic cell types reveals that Purkinje cell dendrite branching is constrained by material costs, while motoneuron dendrite branching is constrained by conduction time delay. We extend this model to incorporate asymmetric branching, where there are multiple different paths from the soma to the synapses, and thus multiple interpretations of conduction time delay: one considers the optimal path, and the other considers the sum of all possible paths, leading to different predictions. We find that the data for motoneurons show a distinction between the asymmetric and symmetric branching junctions corresponding to predictions using different interpretations of the time delay constraint. Moreover, the more asymmetric branching junctions are localized near the synapses, indicating that different functional principles affect the structure at different regions of the cell. Finally, we use machine learning methods to classify cell types using functionally relevant structural parameters derived from our model. Incorporating branching level as a feature in classification, in addition to parameters related to information flow, improves performance across methods, suggesting that information flow drives localized differences in morphology. Future directions of this work include estimating specific parameters related to functional tradeoffs and myelination using numerical optimization and analyzing changes across stages of development.

Exploring the Brain's Intricacies: An Introduction to Neuron Structure and Sleep. An astonishingly sophisticated organ, the human brain, is responsible for a plethora of life-sustaining processes. A network of neurons, the basic units responsible for information transmission within the brain, is at the core of its activities. Neuronal architecture is a key to understanding many cognitive and physiological processes, including sleep. The

most mysterious human experience Building Blocks of Neurons The Brain s Architectural Mysteries A nervous system s principal functional unit is a neuron also called a nerve cell The brain is an enormous network that enables the transmission of impulses at lightning speed it is composed of billions of these complex cells Multiple parts all of which are essential to the neuron s operation make up a normal neuron The cell body often called the soma is the nucleus of the neuron It is home to the cell s genetic material and regulatory center the nucleus It is the job of the cell body to process incoming signals and determine if an electrical impulse should be transmitted The dendrites are the parts of a neuron that extend outward from the cell body and receive impulses sent by neighboring neurons These complex networks enhance the amount of surface area that may be used for synaptic connections which are the building blocks of neuronal communication Nerve Membranes Patricia V. Johnston, Betty I. Roots, 2013-10-22 Nerve Membranes A Study of the Biological and Chemical Aspects of Neuron Glia Relationships presents the various aspects of neuronal and glial structure and function This book provides an interdisciplinary approach to the analysis of neuron glia relationships and of membranes in the nervous system Comprised of seven chapters this book begins with an overview of the function of the biological membranes to improve retard and regulate the rate of cellular reactions This text then determines the differences in the organization of the cells in the nervous system in the vertebrates and the invertebrates Other chapters examine the role of certain intermolecular forces and of water in the organization of lipid protein and lipid lipid associations This book reviews as well the theories of biological membrane structure and considers how these contribute towards understanding the methods by which membranes perform their role This book is a valuable resource for neuroscientists neurochemists and researchers **Advancing Our Understanding of Structure and Function in the Brain: Developing Novel Approaches for Network Inference and Emergent Phenomena** Chris G. Antonopoulos, Nicolás Rubido, Antonio Batista, Murilo S. Baptista, 2021-02-09 *The Neural Ring* Nora Esther Youngs, 2014 Neurons in the brain represent external stimuli via neural codes These codes often arise from stimulus response maps associating to each neuron a convex receptive field An important problem confronted by the brain is to infer properties of a represented stimulus space without knowledge of the receptive fields using only the intrinsic structure of the neural code How does the brain do this To address this question it is important to determine what stimulus space features can in principle be extracted from neural codes This motivates us to define the neural ring and a related neural ideal algebraic objects that encode the full combinatorial data of a neural code We find that these objects can be expressed in a canonical form that directly translates to a minimal description of the receptive field structure intrinsic to the neural code We consider the algebraic properties of homomorphisms between neural rings which naturally relate to maps between neural codes We show that maps between two neural codes are in bijection with ring homomorphisms between the respective neural rings and define the notion of neural ring homomorphism a special restricted class of ring homomorphisms which preserve neuron structure We also find connections to Stanley Reisner rings and use ideas similar to those in the theory of
