

Cell Cycle Regulation

Quality control inspectors typically do not limit their product testing to the final product at the end of the assembly line. They monitor all aspects of production in hopes of preventing larger problems down the line. Likewise, when cells are progressing through the cell cycle there are processes in place that check on the cell's progress. Is everything happening according to plan? Are there sufficient resources to complete the task of cell division? Tightly regulating the cell cycle keeps a multicellular organism healthy by conserving materials. This ensures that new cells receive accurate genetic information, and also prevents uncontrolled growth that may lead to diseases like cancer.

Model 1 – The Cell Cycle

1. Model 1 displays the four major phases of the cell cycle. Identify each of these phases and briefly describe the purpose of each phase.
2. There are three regulatory checkpoints built into the cell cycle. Indicate the phase in which each checkpoint occurs and in which part of the phase (early or later) it occurs.
3. Progression through the cell cycle is dependent on both extra- and intra- cellular conditions. Consider the following conditions that the cell checks for before proceeding further in its cycle. Indicate which checkpoint(s) most likely responds to that condition and explain your reasoning.
