Polymerase Chain Reaction

Synopsis

In this Polymerase Chain Reaction (PCR) simulation, you will see through eight easy-to-understand scenes how to introduce DNA target, primer, to investigate the target, amplify and finally detect the product using gel electrophoresis. The focus of this simulation may vary to suit all your goals.

Design and

After sampling, you will go to the next-to-last scene where the sample of DNA you collected by using a microchip is thermocycled, and this amplification from the initial source is repeated to give the final DNA target sequence exponentially the PCR amplification.

How the structure of final sample amplification is altered

In the simulation, you learn that PCR amplification on the molecular level illustrating the structure of final and the amplification cycle including all the steps involved throughout the experimental process, as well as all specifications of the PCR itself.

Identify the molecules

In the PCR simulation, you will collect your sample and other essential samples from the laboratory, and you will then compare the polymerase for changes and use the data to identify the structure.

Learning Objectives

In this part of this simulation, you will see reports

1. Identify the function of each polymerase, primer, template and product.
2. Explain in detail how PCR using DNA, primers, a buffer, and heat is used in the laboratory.
