Earth Materials

Rocks and Processes of the Rock Cycle

The Rock Cycle

- The rock cycle depicts how the three major rock types (igneous, sedimentary, and metamorphic) convert from one to another.
- · Most changes happen very slowly.
- Rocks deep within the Earth are usually in the process
 of changing, while rocks on the surface tend to lie in place for a while before being exposed
 to a changing process.

The Three Rock Types

Igneous	Cooling and hardening of molten magma. Rate of cooling determines what rock forms.	The composition of the magma that created it.
Sedimentary	Compaction and cementing together of sediments and other minerals or organic materials. Sediments are formed from weathering and erosion of preexisting rocks.	Sediments, broken pieces of rock-like gravel, sand, silt, clay, organic materials, and chemical precipitates.
Metamorphic	Minerals in an existing rock are changed by heat or pressure below the surface.	Similar to that of igneous and sedimentary

Study Tip

Matter constantly flows and

changes on the Earth. You may

have already learned about the water cycle and carbon cycle.

With the rock cycle, try to draw

parallels between concepts to

Rock Process 1: Crystallization

- Crystallization: The formation of mineral grains from cooling magma.
- Magma cools either underground or on the surface and hardens into an igneous rock.
- As magma cools, different crystals form at different temperatures. The cooling rate establishes how much time crystals will have to form. Slow cooling produces larger crystals.

Rock Process 2: Erosion and Sedimentation

- Weathering wears rocks at the Earth's surface down into smaller pieces, called sediments.
- · Running water, ice, and gravity all transport these sediments from one place to another by erosion
- To form sedimentary rock, sediment must compact and cement together.
