current drinking water standards to adequately protect human health is presented along with analysis of the extent of pollution in our water resources and drinking water The authors also present detail of the currently available state of the art technologies which if fully employed can move us toward a healthier future Addresses the international problems of outdated standards and the overwhelming onslaught of new contaminants Includes new monitoring data on non regulated chemicals in water sources and drinking water Includes a summary of different bottled waters as well as consumer water purification technologies

Adsorptive Iron Removal from Groundwater Sharoz Kumar Sharma,2021-05-30 A pilot study conducted at the Gilze water treatment plant of Water Supply North West Brabant demonstrated that adsorptive filtration has several potential advantages over floc filtration namely longer filter runs due to slower head loss development better filtrate quality shorter ripening time and less backwash water use In existing groundwater treatment plants the high iron II adsorption capacity of the iron oxide coated filter media makes it potentially possible to switch the governing mode of operation from floc filtration to adsorptive filtration To achieve this two options can be considered iron II adsorption under anoxic conditions followed by oxidation with oxygen rich water and adsorption of iron II in the presence of oxygen and simultaneous oxidation The first option might be attractive specifically when two filtration steps are available
