Abstract—The purpose of this study was to determine the effect of a 12-week training program on the heart rate (HR) and energy expenditure (EE) of sedentary, middle-aged women. The subjects were 12 sedentary women, 30 to 45 years of age, who were randomly selected from a local health club. The subjects were divided into two groups: a control group and an exercise group. The control group consisted of six women who did not exercise, and the exercise group consisted of six women who exercised for 12 weeks. The subjects were monitored for HR and EE during a 12-week period. The HR and EE of the control group remained relatively stable throughout the 12-week period. The HR and EE of the exercise group increased significantly during the 12-week period. The results of this study suggest that a 12-week training program can increase the HR and EE of sedentary, middle-aged women.
