Evaluation of Methods for Determining Nahcolite and Dawsonite in Oil Shales Charles W. Huggins,Thomas E. Green,Theodore L. Turner,1973 **Applied Spectroscopy** ,1963 *Proceedings of the Ocean Drilling Program* Ocean Drilling Program,1994 *Report of Investigations* ,1973 **Nanopowders of Metal Oxides and Fluorides** Sergey Sokovnin,Vladislav Ilves,2022-12-27 One of the directions of nanotechnology is the production of nanopowders NPs Nanopowders according to the currently widely used classification of nanomaterials belong to zero dimensional systems in which the limitation of wave functions occurs in all three directions Biological methods are considered the most environmentally friendly way to synthesize NPs but the possibility of biological contamination with mutated microorganisms cannot be ruled out This book presents a new method for producing simple and complex metal oxide and fluoride NPs based on the evaporation condensation process using pulsed electron beam evaporation It presents the results of more than 10 years of study of the characteristics of NPs produced using the aforementioned method This eco friendly method ensures the production of clean NPs which are mesoporous and suitable for use in various applications such as medicine spintronics optoelectronics dosimeters photocatalysis semiconductors and ultraviolet and blue lasers Importantly these NPs have the potential to be used as a drug delivery system and in the creation of new nanostructures that do not contain noble metals The book will be useful for the researchers in macromolecular science nanotechnology chemistry biology and medicine especially those with an interest in drug delivery or cancer therapy *The Role of Chemical Markers and Chemometrics in the Identification of Grasses Used as Food in Pre-agrarian South West Asia* Michelle Cave,2004 This work explores the way in

which novel chemical criteria can be used to identify charred remains of grains of small grained grasses used as food by pre agrarian hunter gatherers in south western Asia but which have hitherto rarely been identified with any precision The grass family Gramineae or Poaceae is the most diverse abundant and widespread family of higher plants on the planet Grasses correspondingly have enormous ecological and economic importance worldwide Their importance is reflected in the prominent role of grain from wild grasses in hunter gatherer subsistence In order to reconstruct past subsistence practices and diet especially of arid zone hunter gatherers it is important to identify the remains of grasses recovered from archaeological sites However the recovered grass remains are most often charred therefore the interpretive potential can be realized only if these charred remains are accurately identified at the level of genus and in some cases species There are enormous problems in identifying charred remains particularly when relying totally on gross morphological criteria There is therefore a need for alternative criteria such as that utilized by chemical analytical techniques The core rationale in applying the different chemical techniques is the same throughout grains are taken from modern grasses of known identity and spanning a spectrum of taxa likely to include all the charred ancient specimens to be identified the unknowns These modern grains are then analysed to generate spectra Equivalent spectra from unknowns are then compared with those from the modern grains to effect an identification Standard practice has hitherto involved comparing the two sets of spectra know and unknowns by visual inspection i e by eye However identifications based on such comparisons are inevitably to some degree untestable and unrepeatable and this represents a long standing problem in chemistry generally In the present project the author has therefore explored the use of chemometrics i e the use of statistical systems to compare spectra in a manner that is rigorously testable and repeatable This is an entirely new development and has never previously been applied in the analysis of archaeological data
