

## Keystone Species

Saguaro Cactus

### What is a keystone species?

A keystone species is a species that has a disproportionately large effect on its environment relative to its abundance. The concept was developed by ecologist Robert Paine in 1969, based on his work with intertidal invertebrates. The term "keystone" is derived from the keystone of an arch, which is the central, topmost stone that holds the entire structure together.

Keystone species can be found in all types of ecosystems, from marine environments to terrestrial ones. They can be plants, animals, or even microorganisms. The removal of a keystone species can lead to significant changes in the structure and function of an ecosystem, often resulting in a loss of biodiversity.

### Why is the Saguaro a keystone species?

The Saguaro cactus is a keystone species in the Sonoran Desert. It provides food and shelter for many other species, including birds, lizards, and insects. The cactus also plays a role in the water cycle, storing water in its thick stems and releasing it slowly over time. Without the Saguaro, the desert ecosystem would be fundamentally altered.
