Modern Anesthetics Jürgen Schüttler,Helmut Schwilden,2008-01-08 Some important constraints of anesthesia must be taken into consideration when the pharmacological properties of modern anesthetics are discussed The most important of these could be that the target effect be achieved preferably within seconds at most within a few minutes Similarly offset of drug action should be achieved within minutes rather than hours The target effects such as unconsciousness are potentially life threatening as are the side effects of modern anesthetics such as respiratory and cardiovascular depression Finally the patient's purposeful responses are not available to guide drug dosage because either the patient is unconscious or more problematically the patient is aware but unable to communicate pain because of neuromuscular blockade These constraints were already recognised 35 years ago when in 1972 Volume XXX entitled Modern Inhalation Anesthetics appeared in this Handbook Series The present volume is meant as a follow up and extension of that volume At the beginning of the 1970s anesthesia was commonly delivered by inhalation with only very few exceptions The clinical understanding of that time considered anesthesia as a unique state achieved by any of the inhalation anesthetics independent of their specific molecular structure The very mechanism of anesthetic action at the biophase was discussed within the theoretical framework of the unitary theory of narcosis
