Metamorphic Rocks

Metamorphic rocks are formed from pre-existing rocks (igneous, sedimentary, or metamorphic) through the process of metamorphism. This process involves changes in temperature, pressure, and chemical environment, which cause the minerals in the rock to recrystallize and form new minerals.

Metamorphic rocks are classified based on the temperature and pressure conditions under which they formed. The main types of metamorphic rocks are:

- Schist**: Formed at high temperature and medium to high pressure. Characterized by a foliated texture with visible mineral grains.
- Gneiss**: Formed at high temperature and high pressure. Characterized by a banded texture with alternating layers of light and dark minerals.
- Quartzite**: Formed from sandstone at high temperature and low to medium pressure. Characterized by a crystalline texture with interlocking quartz grains.
- Marble**: Formed from limestone at high temperature and low to medium pressure. Characterized by a crystalline texture with interlocking calcite grains.
