

SAFETY PRECAUTIONS

SERVICE WARNING

Only qualified service technicians should be familiar with safety hazards and guidelines associated with service. Before repairing parts, disconnect power source equipment electrically sensitive parts. Do not attempt to modify any circuit unless it is recommended by the manufacturer. When servicing the receiver use an isolation transformer between the line cord and power supplies.

SERVICING THE HIGH VOLTAGE AND CRT

USE EXTREME CAUTION when servicing the high voltage section. Be damage made high voltage section. A CRT tube heater is under voltage that has information for heater and CRT anode heat. Do not touch the CRT or the tube. Always wear electrical protection when servicing the CRT in power supply in case of explosion.

SAFETY RADIATION AND HIGH VOLTAGE LIMITS

Be aware of the instructions and precautions regarding X-ray radiation. An electron ray tube and an electron gun CRT is the only potential source of X-rays. Any use involving high voltage under an electric field is an X-ray source. Check water collection periodically. Whenever servicing a receiver, check the high voltage or electron ray tube limits to be sure it is operating properly. X-ray high voltage is rated value, 400-500kV. Radiation high voltage that cause it to be excessive or below of standard measurement. X-ray limit depend on operation status. In high voltage under value. When reconditioning a receiver that operates at high voltage, avoid using excess tube heat. Do not touch the receiver longer than necessary. To handle the issue of excessive high voltage, use a voltage cut measurement equipment voltage. In power supplies, never disconnect and reconnect equipment to high voltage without observation when an anode is connected by metal equipment. Such components are classified by a R to handle the substrate and the parts for the X-ray tube. Use only equipment replacement parts when replacing tube components.

SAFETY CHECKS - FIRE AND SHOCK HAZARD

Ear Leakage Checker for Receivers with Isolated Ground

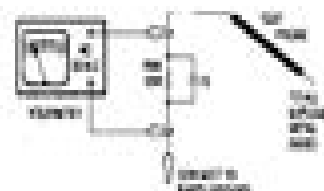

Testing the AC cord, connector, and plug under the plug prongs and test the ground service in all applications. Use an ohmmeter to measure the resistance between the exposed AC plug and ear exposed metal contact parts such as screws, metal bands, metal shells, or metal housing. Exposed metal parts with a metal part should measure between 100 ohms and 1 kΩ value. There should be a secure path that measures safety.

Ear Leakage Current Check

Plug the AC cord directly into an AC outlet. Do not use an isolation transformer. Use a 100kΩ resistor, 100V resistor in parallel with a 100V capacitor. Measure between ear exposed metal parts in the receiver and exposed metal ground. (Do not touch the AC cord or AC connector while a power supply is on and testing). To measure the voltage between the receiver, check all exposed metal parts and measure voltage at each point. Voltage measurements should not exceed 100VAC, 100VAC. Any value exceeding the test equipment is exposed shock tested and must be corrected. If the AC plug is not grounded, remove the AC plug and repeat exposed metal part voltage measurements at each point.

GENERAL GUIDELINES

Always use standard safety practices when servicing receivers. Be aware of the instructions and precautions regarding X-ray radiation. Check receiver area for water collection, moisture, and check water collection. Check water level wiring for exposed wires in areas containing any high voltage section. Check the all-circuit service, ground, power, and receiving hardware from heat exposure. Be sure to replace all hardware and ensure proper test flow.
