Manual Asymmetries, Handedness and Motor Performance Pamela Bryden, Andrea Helen Mason, Claudia L. R.

Gonzalez, 2016-06-10 The performance of most tasks with one hand typically the right is a uniquely human characteristic Not only do people prefer to use one hand rather than the other but also they usually perform tasks faster and more accurately with this hand The study of manual asymmetries and what such performance differences between the two hands reveal about brain organization and motor function has been a topic of considerable research over the last several decades The aim of this Research Topic is to review and further explore the origins of manual asymmetries and their relationship to handedness unimanual and bimanual motor performance and brain function The articles included here involve original research conducted in humans or non human models species as well as theoretical perspectives review articles and meta analyses

Cognition in Schizophrenia and Paranoia Peter A. Magaro, 2023-07-21. Originally published in 1980, Cognition in Schizophrenia and Paranoia presents a theoretical framework that relates three fields of psychology: the experimental research in psychopathology, the developmental literature on intellectual growth, and the literature on hemispheric specialization. The specifications of the separate processes and their integration provides the means to reanalyze our empirical operations and theoretical terms in order to provide a more complete level of understanding or at least alert us to additional possibilities in research strategies. Today it can be read in its historical context.

The Psychology of Closed Self-Paced Motor Tasks in Sports Ronnie Lidor, Gal Ziv, 2022-06-01. In practice settings, competitions and games, athletes are often required to perform an arsenal of motor tasks in dynamic and challenged sporting environments where they have to respond without having enough time to prepare themselves for the act. However, in many sport activities, athletes also perform closed self-paced motor tasks that take place in a relatively stable and predictable environment where there is adequate time to prepare for their execution. Among these tasks are free throw shots in basketball, putting in golf, serving in tennis, and bowling. In these tasks, performers are able to plan their actions in advance. They can activate a plan, a strategy, a protocol, or a procedure, what we term a ritual behavior. Effective rituals are usually achieved with a high degree of consistency. That is, either deliberately or subconsciously, they become an integral part of the act itself. The Psychology of Closed Self-Paced Motor Tasks in Sports explores those plans, procedures, protocols, strategies, and techniques that aim at facilitating the performance and learning of closed self-paced motor tasks. Included in the instructional psychological routines discussed in this book are pre-performance routines, focusing attention, motor imagery, enhanced expectancies, autonomy support, gaze strategies, self-talk, and periodization. The routines discussed in the book are evidence-based. Based on updated reviews of laboratory and field inquiries on the discussed instructional psychological routines, practical implications are given for those professionals who teach closed self-paced motor tasks, including coaches, instructors, and sport psychology consultants.

Sleep Loss and Its Effects on Performance Paul Naitoh, 1969. The effects of sleep loss on human task performance are discussed under total, partial, and selective deprivations of sleep. Factors which play critical roles in determining the degree of task

sensitivity to total sleep loss are listed Effects of shortened hours of sleep on human task performance are discussed Effects of selected sleep deprivation on performance are also commented upon The commentary is followed by a bibliography on sleep deprivation with author and subject indices **Quality Circles** Russell F.
