Abstract

Figure 1

Moderate to high density metals, with high melting and boiling points, many have high hardness and mechanical strength. Those from IV onwards are synthetic. Chemically show variable valency and strong tendency to form coordination and colored compounds. Oxides are basic, amphoteric or acidic, depending on oxidation state.

100

Resistant to corrosion and oxidation, unlike base metals such as Fe, Ni, Cu and Zn. Commonly found together in nature form. Good catalytic properties. Very easily distinguished from the other metals.

1. **Introduction**

Soft (or brittle), low strength, and with melting points lower than transition metals. Crystalline structures tend to show directional bonding, with generally greater complexity or fewer nearest neighbours than other metals. All used or mined as soft metal lubricants. Most are chemically weak; a minority are moderately electropositive. Characterised, to varying degrees, by covalent bonding tendencies, anisotropy, and ionic species such as trihalides, silicides, and boronhydrides.

¹ O, F, and Cl are, respectively, colorless, pale yellow, and pale yellow-green gases; Br is a red-brown liquid; I is a metallic looking solid. Chemically tend to have a high ionization energies, electron affinities, and electronegativity values, and be relatively strong oxidizing agents. Manifestations include oxygen's major association with the ubiquitous processes of corrosion and combustion, and the intrinsically corrosive nature of the non-metallic halogens. All five tend to form predominantly ionic compounds with metals. Their oxides are acidic.

100

Colorless, odorless, non-flammable gases with very low chemical reactivity. The first noble gas compound, of approximate composition XePtF_6 , was not prepared until 1962. More than half-a-thousand noble gas compounds were synthesized in the ensuing half-century. Compounds of the He and Ar, in ancient conditions, are not known.
