Introduction to Understandable Physics Will Winn, 2010-07 Will Winn has written *Introduction to Understandable Physics* with the goal of presenting physics in a building block fashion Accordingly Volume III Electricity Magnetism and Light requires a knowledge of Volume I Mechanics and Volume II Matter Heat and Waves Volume III begins with a study of electric charges their electric fields forces and subsequently their motion as electric currents These currents are shown to produce magnetic fields forces where electromagnets are studied as models for understanding permanent magnets Next The reverse process where magnetic fields produce current is examined and applied for generating electricity AC and DC circuits exemplify further applications Finally electric and magnetic fields are found to produce electromagnetic waves that move at the speed of light The study of light begins with historical measurements of its speed and then examines its electromagnetic power intensity light spectra human response and color perception Next light reflection and refraction are applied to mirrors lenses rainbows eyeglasses telescopes and microscopes Subsequently The text examines the wave nature of light As exhibited by its diffraction and interference phenomena Furthermore when the electric field amplitudes of waves are oriented along one dimension light is polarized Polaroids filter out such glaring light when used in sunglasses Finally various light experiments provided early clues for discovering relativity and quantum mechanics which are examined in Volume IV Near the end of each chapter a Simple Projects section suggests experiments and or field trips that can reinforce the physics covered Some experiments are simple enough for students to explore alone while others benefit from equipment available to physics instructors Also optional text sections provide students with a deeper appreciation of the subject matter however these are not required for continuity Some of these optional topics can be candidates for term projects
