Example 3 indicates that the mean of the vibrating object influences the frequency of simple harmonic motion. Electronic sensors are being developed that take advantage of this effect in detecting and measuring small amounts of chemical. These sensors are crystalline quartz crystals that vibrate when an electric current passes through them. If a crystal resonates at a substance that absorbs a particular chemical, then the mean of the  $f$  is 0.1 kHz (Equation 10.4 and 10.5). The frequency of the simple harmonic motion is altered. This change in frequency is detected electronically, and the amount is used to give the mean of the chemical's chemical.
