Borradaile, 2013-11-11 The Goals of

Data Collection and Its Statistical Treatment in the Earth Sciences The earth sciences are characterised by loose and

complex relationships between variables and the necessity to understand the geographical distribution of observations as well as their frequency distribution Our frequency distributions and the looseness of relationships reflect the complexity and intrinsic natural variation in nature more than measurement error Furthermore earth scientists cannot design experiments according to statistical recommendation because the availability and complexity of data are beyond our control Usually the system we are studying cannot be isolated into discrete independent variables These factors influence the first steps of research how and where to collect specimens or observations Some issues are particularly troublesome and common in earth science but are rarely handled in an undergraduate statistics course These include spatial sampling methods orientation data regionalised variables time series identification of cyclicity and pattern discrimination multivariate systems lurking variables and constant sum data It is remarkable that most earth science students confront these issues without formal training or focused consideration

Mechanical Properties of Metals C. W. Lung,Norman Henry March,1999 The book is intended to describe the basic and newly developed elements of the physics of solids and materials science on mechanical properties of metals with as much continuity as is possible Particular emphasis has been placed in atomistic and fractal approaches and continuum theory of dislocations is also introduced Since the book is meant for the two main topics of progress in recent years some interesting and important topics which have not been discussed or introduced are given in detail For a long time pair potentials were used very expensively in simulation studies They can reproduce usefully total energies for many systems But when one turns to elastic properties fracture of surfaces and the vacancy formation energy deficiencies and limitations begin to emerge These limitations of the simple pair potential approximation have been addressed by the development of empirical many body potentials which is the major theme of our book Over a decade or more diverse scientists have recognized that many of the structures common in their experiments have a special kind of geometrical complexity The key to this progress is the recognition that many random structures obey a symmetry that objects look the same on many different scales of observation The concept of fractals was introduced by Mandelbrot and applied to fractures by himself and collaborators Their work pointed to a correlation between toughness and the fractal

dimension Our interest is the fractal aspects of fractured surfaces We will discuss more in our book The strain field of a dislocation has a long range part and this part can be discussed rigorously from elasticity theory Recent progress in elastic strain fields and dislocation mobility were made by Indenbom and Lothe The elementary essentials will be introduced in our book *Convergence and Hybrid Information Technology* Geuk Lee, Daniel Howard, Dominik Slezak, You Sik
