mathematical theory of nonlinear oscillations and its development The work offers a critical examination of sources with a focus on the twentieth century especially the period between the wars Readers will see that contrary to what is often written France's role has been significant Important contributions were made through both the work of French scholars from within diverse disciplines mathematicians physicists engineers and through the geographical crossroads that France provided to scientific communication at the time This study includes an examination of the period before the First World War which is vital to understanding the work of the later period By examining literature sources such as periodicals on the topic of electricity from that era the author has unearthed a very important text by Henri Poincaré dating from 1908 In this work Poincaré applied the concept of limit cycle which he had introduced in 1882 through his own works to study the stability of the oscillations of a device for radio engineering The discovery of this text means that the classical perspective of the historiography of this mathematical theory must be modified Credit was hitherto attributed to the Russian mathematician Andronov from correspondence dating to 1929 In the newly discovered Poincaré text there appears to be a strong interaction between science and technology or more precisely between mathematical analysis and radio engineering This feature is one of the main components of the process of developing the theory of nonlinear oscillations Indeed it is a feature of many of the texts referred to in these chapters as they trace the significant developments to which France contributed Scholars in the fields of the history of mathematics and the history of science and anyone with an interest in the philosophical underpinnings of science will find this a particularly engaging account of scientific discovery and scholarly communication from an era full of exciting developments

Predicting the T2K Neutrino Flux and Measuring Oscillation Parameters Tomislav Vladislavljovic, 2020-09-14 This thesis reports the calculation of neutrino production for the T2K experiment the most precise a priori estimate of neutrino production that has been achieved for any accelerator based neutrino oscillation experiment to date The production of intense neutrino beams at accelerator facilities requires exceptional understanding of chains of particle interactions initiated within extended targets In this thesis the calculation of neutrino production for T2K has been improved by using measurements of particle production from a T2K

replica target taken by the NA61 SHINE experiment This enabled the reduction of the neutrino production uncertainty to the level of 5% which will have a significant impact on neutrino oscillation and interaction measurements by T2K in the coming years In addition to presenting the revised flux calculation methodology in an accessible format this thesis also reports a joint T2K measurement of muon neutrino and antineutrino disappearance and the accompanying electron neutrino and antineutrino appearance with the updated beam constraint
