

Gayle runs at a speed of 4.00 m/s and dives on a sled, initially at rest on the top of a frictionless, snow-covered hill. After she has descended a vertical distance of 5.00 m, her brother, who is initially at rest, hops on her back and they continue down the hill together. What is their speed at the bottom of the hill if the total vertical drop is 15.0 m? Gayle's mass is 50.0 kg, the sled has a mass of 5.00 kg, and her brother has a mass of 30.0 kg.

Physics Problem Solver The Editors of REA, Joseph Molitoris, 2012-05 The Problem Solvers are an exceptional series of books that are thorough unusually well organized and structured in such a way that they can be used with any text No other series of study and solution guides has come close to the Problem Solvers in usefulness quality and effectiveness Educators consider the Problem Solvers the most effective series of study aids on the market Students regard them as most helpful for their school work and studies With these books students do not merely memorize the subject matter they really get to understand it Each Problem Solver is over 1 000 pages yet each saves hours of time in studying and finding solutions to problems These solutions are worked out in step by step detail thoroughly and clearly Each book is fully indexed for locating specific problems rapidly Comprehensive problems for topics covered by Physics I to IV including statics dynamics heat electricity and magnetism wave motion acoustics optics and atomic and nuclear physics Numerous pictorial diagrams are included with complete illustrative explanations Problem solving strategies are included at the beginning of every chapter for each topic covered

3+1 Formalism in General Relativity Éricourgoulhon, 2012-02-27 This graduate level course based text is devoted to the 3+1 formalism of general relativity which also constitutes the theoretical foundations of numerical relativity The book starts by establishing the mathematical background differential geometry hypersurfaces embedded in space time foliation of space time by a family of space like hypersurfaces and then turns to the 3+1 decomposition of the Einstein equations giving rise to the Cauchy problem with constraints which constitutes the core of 3+1 formalism The ADM Hamiltonian formulation of general relativity is also introduced at this stage Finally the decomposition of the matter and electromagnetic field equations is presented focusing on the astrophysically relevant cases of a perfect fluid and a perfect conductor ideal magnetohydrodynamics The second part of the book introduces more advanced topics the conformal transformation of the 3 metric on each hypersurface and the corresponding rewriting of the 3+1 Einstein equations the Isenberg Wilson Mathews approximation to general relativity global quantities associated with asymptotic flatness ADM mass linear and angular momentum and with symmetries Komar mass and angular momentum In the last part the initial data problem is studied the choice of spacetime coordinates within the 3+1 framework is discussed and various schemes for the time integration of the 3+1 Einstein equations are reviewed The prerequisites are those of a basic general relativity course with calculations and derivations presented in detail making this text complete and self contained Numerical techniques are not covered in this book

Elementary Differential Equations and Boundary Value Problems William E. Boyce, Richard C. DiPrima, Douglas B. Meade, 2017-08-21 Elementary Differential Equations and Boundary Value Problems 11e like its predecessors is written from the viewpoint of the applied mathematician whose interest in differential equations may sometimes be quite theoretical sometimes intensely practical and often somewhere in between The authors have sought to combine a sound and accurate but not abstract exposition of the elementary theory of differential equations with

considerable material on methods of solution analysis and approximation that have proved useful in a wide variety of applications While the general structure of the book remains unchanged some notable changes have been made to improve the clarity and readability of basic material about differential equations and their applications In addition to expanded explanations the 11th edition includes new problems updated figures and examples to help motivate students The program is primarily intended for undergraduate students of mathematics science or engineering who typically take a course on differential equations during their first or second year of study The main prerequisite for engaging with the program is a working knowledge of calculus gained from a normal two or three semester course sequence or its equivalent Some familiarity with matrices will also be helpful in the chapters on systems of differential equations

Scientific Imperialism Uskali Mäki, Adrian Walsh, Manuela Fernández Pinto, 2017-10-16 The growing body of research on interdisciplinarity has encouraged a more in depth analysis of the relations that hold among academic disciplines In particular the incursion of one scientific discipline into another discipline's traditional domain also known as scientific imperialism has been a matter of increasing debate Following this trend Scientific Imperialism aims to bring together philosophers of science and historians of science interested in the topic of scientific imperialism and in particular interested in the conceptual clarification empirical identification and normative assessment of the idea of scientific imperialism Thus this innovative volume has two main goals Indeed the authors first seek to understand interdisciplinary relations emerging from the incursion of one scientific discipline into one or more other disciplines such as in cases in which the conventions and procedures of one discipline or field are imposed on other fields or more weakly when a scientific discipline seeks to explain phenomena that are traditionally considered proper of another discipline's domain Secondly the authors explore ways of distinguishing imperialistic from non imperialistic interactions between disciplines and research fields The first sustained study of scientific imperialism this volume will appeal to postgraduate students and postdoctoral researchers interested in fields such as Science and Technology Studies Sociology of Science Technology Philosophy of Science and History of Science

Model Development and Optimization V.V. Ivanov, 2013-11-09 At present intensive development of computer hardware and software computer based methods for modeling of difficult problems have become the main technique for theoretical and applied investigations Many unsolved tasks for evolutionary systems ES are an important class of such problems ES relate to economic systems on the whole and separate branches and businesses

scientific and art centers ecological systems populations separate species of animals and plants human organisms different subsystems of organisms cells of animals and plants and soon Available methods for modeling of complex systems have received considerable attention and led to significant results No large scale programs are done without methods of modeling today Power programs health programs cosmos investigations economy designs etc are a few examples of such programs Nevertheless in connection with the permanent complication of contemporary problems existing means are in need of subsequent renovation and perfection In the monograph along with analysis of contemporary means new classes of mathematical models MM which can be used for modeling in the most difficult cases are proposed and justified The main peculiarities of these MM offer possibilities for the description of ES creation and restoration processes dynamics of elimination or reservation of obsolete technology in ES dynamics of resources distribution for fulfillment of internal and external functions of ES and so on The complexity of the problems allows us to refer to the theory and applications of these MM as the mathematical theory of development For simplicity the title Model Development and Optimization was adopted

Linguistic Geometry Boris Stilman, 2012-12-06 *Linguistic Geometry From Search to Construction* is the first book of its kind Linguistic Geometry LG is an approach to the construction of mathematical models for large scale multi agent systems A number of such systems including air space combat robotic manufacturing software re engineering and Internet cyberwar can be modeled as abstract board games These are games with moves that can be represented by the movement of abstract pieces over locations on an abstract board The purpose of LG is to provide strategies to guide the games participants to their goals Traditionally discovering such strategies required searches in giant game trees These searches are often beyond the capacity of modern and even conceivable future computers LG dramatically reduces the size of the search trees making the problems computationally tractable LG provides a formalization and abstraction of search heuristics used by advanced experts including chess grandmasters Essentially these heuristics replace search with the construction of strategies To formalize the heuristics LG employs the theory of formal languages i e formal linguistics as well as certain geometric structures over an abstract board The new formal strategies solve problems from different domains far beyond the areas envisioned by the experts For a number of these domains Linguistic Geometry yields optimal solutions [Aerospace Engineering on the Back of an Envelope](#) Irwin E. Alber, 2012-03-05 Engineers need to acquire Back of the Envelope survival skills to obtain rough quantitative answers to real world problems particularly when working on projects with enormous complexity and very limited resources In the case studies treated in this book we show step by step examples of the physical arguments and the resulting calculations obtained using the quick fire method We also demonstrate the estimation improvements that can be obtained through the use of more detailed physics based Back of the Envelope engineering models These different methods are used to obtain the solutions to a number of design and performance estimation problems arising from two of the most complex real world engineering projects the Space Shuttle and the Hubble Space Telescope satellite

Optimal Navigation in Active Matter Lorenzo Piro, 2024-02-28 Efficient navigation in terms of travel time and energy dissipation is of crucial importance for biological micro swimmers The design of optimally navigating artificial swimmers also has potentially valuable applications such as targeted drug delivery which has become an increasingly realistic perspective due to the recent progress in the experimental realization of controllable microswimmers able to perform nontrivial tasks Despite recent theoretical progress the field still faces open challenges notably in describing navigation problems that take into account the complexities of the world of microswimmers This book presents a selection of works on the problem of optimal microswimmer navigation that represent a significant advance in this direction The material in this book provides important insights into how efficient navigation may be achieved in the presence of curved space geometry confining forces and flows as well as thermal fluctuations Finally the energetic cost of navigation is addressed via a new formulation of the problem that accounts for the swimmer body geometry
