Vectors and Scalars:

Vector quantities have a magnitude and direction e.g. force, momentum, acceleration.

Scalar quantities have a magnitude but no direction e.g. mass, temperature, time.

Contact/ non-contact forces:

A force is a push or pull caused by objects interacting. If 2 objects need to touch for a force to act it is called a contact force e.g. friction, tension in ropes. A non-contact force is when objects don't need to touch to interact e.g. gravity, magnetism.

When a force transfers energy, we say the force has done work and the energy has been transferred mechanically.

Some energy will be dissipated in any energy transfer (as wasted energy). We use sankey diagrams to show this.

Energy can also be transferred electrically (rather than mechanically by a force). This happens in all electrical devices.

Energy can be transferred by heating when the energy in the thermal energy store from a hotter object is moved to a cooler object.

Green

Work done:

When a force moves an object a distance, work is done and energy has been transferred. Work done is an energy.

If the work done has changed something's speed or height you can also use the GPE and KE equations. The work done will be equal to the change in KE or GPE.

Energy dissipation:

When a force does work, it usually causes a rise in temperature. That is because the force has done work against frictional forces and this energy is dissipated to the surroundings. We can reduce the energy dissipated this way by using lubrication. The less wasteful an energy transfer, the higher its efficiency.

$$\text{efficiency} = \frac{\text{useful energy transferred by the device}}{\text{total energy supplied to the device}}$$

Power is the rate that energy is transferred (or the rate of work done). The unit is the Watt. A powerful machine transfers a lot of energy in a short space of time (but not all of it will be useful).

Purple

Forces:

When 2 objects interact with forces, there are always a pair of forces - this is Newton's 3rd Law. E.g. The Earth is attracted to the sun by gravity, the other force is that the sun is attracted to Earth by gravity. These forces are equal in size but opposite in direction.

Force Diagrams:

Forces are represented by arrows on objects:

Thrust - acts forwards, force that accelerates an object.

Friction - acts backwards, slows objects down.

Weight - acts downwards - the force of gravity.

When forces are along the same line, we can take them away to find the resultant force.

When they are not along the same line you will need to to a scale diagram. If when drawing a scale diagram, the forces form a loop, the forces are in equilibrium and there is no resultant force.

If forces act at angles they can be split into its horizontal parts and vertical parts.
