

Chapter 7

Polygons

A **polygon** can be described by two conditions:

1. No two segments with a common endpoint are collinear.
2. Each segment intersects exactly two other segments, but only on the endpoints.

A **convex polygon** is a polygon such that no line containing a side of the polygon will contain a point in the interior of the polygon.

convex polygon

concave polygon

Notice, if I extend a side (dashed line) on the right polygon, the line contains interior points. Therefore it is not a convex polygon, it is called a **concave** polygon.

What's the sum of the interior angles of a quadrilateral? a pentagon? an octagon?

The answer is, I just don't know. But ..., if I draw some pictures, that might help me discover the answer.

pentagon
