Jason P is a 42-year-old male admitted with glomerulonephritis to the medical unit.

1. Compare and contrast Acute Glomerulonephritis and Nephrotic syndrome.
- ✓ Glomerulonephritis is an inflammatory condition in which there is some compromise of the glomerular membranes leading to protein loss into urine. This is not serious protein loss and may not have any other symptoms associated with it. If progressive it may lead to acute kidney injury but often glomeruli and nephrons recover their function. Nephrotic syndrome is more drastic loss of protein in urine which is great enough to reduce the concentration of albumin in blood to the point there are osmotic effects, meaning low plasma osmolality is leading to fluid moving into ISF and ECF to cause marked oedema. There is overstimulation of the liver to try and replace the albumin being lost in urine, but this leads to accumulation of other products of the liver, like gamma globulins, clotting proteins and lipids, so thrombotic risk and hyperlipidemia, along with oedema need to be managed. Nephrotic syndrome can lead to chronic kidney disease as glomeruli are damaged to the point they don't recover and sclerosis occurs

Arterial blood gases results for Jason are as follows:

pH 7.33 (normal range 7.35-7.45)
PaO₂ 66mmHg (normal >80mmHg)
PaCO₂ 40mmHg (normal range 35-45mmHg)
HCO₃ 19mM (normal range 22-26mM)

2. What type of acid base imbalance is Jason experiencing?

R = respiratory
O = opposite
