**The effect of muscle pathogenesis on avian physiology, animal welfare, and quality of muscle as a food**

Wei Guo, Sandra G. Velleman, Gale M. Strasburg, 2025-05-15 Over the past several decades the poultry industry has achieved huge improvements in global poultry production including with increased growth performance improved body composition higher market weight increased feed efficiency reduced production costs and increased profitability for growers These gains have resulted from a combination of intensive genetic selection tailored nutritional approaches and novel poultry management strategies However these improvements in broiler chicken and turkey production have also come with costs These costs include increased susceptibility to environmental stress increased mortality in commercial poultry flocks and muscle pathogenesis ultimately leading to deleterious effects on meat quality traits affecting appearance texture and protein functionality For example a subset of fast growing domestic turkeys develops spontaneous cardiomyopathy or round heart disease that leads to a mortality rate up to 15% at 2 to 4 weeks of age Even turkeys that survive the critical first two weeks after hatch already have damaged hearts at a prevalence of 80% to 90% which may lead to growth retardation during the grow out phase This syndrome can also occur in broiler chickens which causes major

economic losses and limits the maximum profitability in the poultry industry world wide Another example is wooden breast an abnormal muscle condition resulting in a hardening of the breast muscle affecting meat texture Other examples include green muscle disease also known as deep pectoral muscle myopathy spaghetti meat and white striping All of these pathologies include the development of myopathic changes subsequently affecting meat quality leading to consumer complaints and economic losses by the processing industry There is a paucity of information on the etiologies of broiler and turkey muscle pathogenesis and their consequent effects on muscle physiology This Research Topic will highlight the mechanisms of skeletal and cardiac muscle pathogenesis in poultry that are responsible for premature bird mortality and altered quality of muscle as a food This research topic will cover the recent findings in the area of myopathies in poultry Original Research and Review papers among other article types are welcome to be submitted to this collection

**Nonparametric Bayesian Inference in Biostatistics** Riten Mitra, Peter Müller, 2015-07-25 As chapters in this book demonstrate BNP has important uses in clinical sciences and inference for issues like unknown partitions in genomics Nonparametric Bayesian approaches BNP play an ever expanding role in biostatistical inference from use in proteomics to clinical trials Many research problems involve an abundance of data and require flexible and complex probability models beyond the traditional parametric approaches As this book's expert contributors show BNP approaches can be the answer Survival Analysis in particular survival regression has traditionally used BNP but BNP's potential is now very broad This applies to important tasks like arrangement of patients into clinically meaningful subpopulations and segmenting the genome into functionally distinct regions This book is designed to both review and introduce application areas for BNP While existing books provide theoretical foundations this book connects theory to practice through engaging examples and research questions Chapters cover clinical trials spatial inference proteomics genomics clustering survival analysis and ROC curve

**High-throughput Sequencing-based Investigation of Chronic Disease Markers and Mechanisms, volume II** Hua Li,Wen-Lian Chen,Yuriy L. Orlov,Guoshuai Cai,2025-06-17 With the recent development of sequencing technology and the rapid reduction of sequencing costs high throughput sequencing including second and third generation sequencing is revolutionizing basic life science research and clinical research from various aspects High

throughput sequencing often produces millions of sequencing reads at a time and the alignment or assembly of these reads allows the determination of various mutations e.g. SNV and Indels at the genomic level accurate gene expression quantification at the transcriptomic level and identification of histone or DNA modification at the epigenomic level The resulting accumulation of enormous multi-omics information has opened up a new era of finding effective disease markers and studying their roles in disease occurrence and development Using high throughput sequencing various markers of chronic diseases such as cancer heart disease diabetes and arthritis have been developed at all omics levels which have been used for diagnosis and classification of diseases prediction of treatment effects and prevention of diseases The quickly and massively acquired multi-omics data together with newly developed algorithms provide an excellent chance for the identification of more reliable biomarkers This research topic aims at 1 developing new chronic disease markers at four levels i.e. genome epigenome transcriptome and translome with the help of high throughput sequencing and 2 delineating potential marker related mechanisms for chronic disease occurrence or development This research topic covers a broad spectrum of interests and studies including both wet lab and dry lab results are more welcomed More specifically this research topic welcomes contributions including but not limited to the following areas 1 Identification of novel biomarkers for chronic disease detection especially in early stage or prognosis prediction using high throughput sequencing 2 characterize the possible pathological causes of markers as well as the potential roles they play in disease initiation and development 3 New high throughput sequencing techniques that facilitate the development of more effective biomarkers of chronic disease 4 New algorithms or tools for in silico identification of effective chronic disease markers based on high throughput sequencing data Please note that 1 the high throughput sequencing for genome epigenome transcriptome and translome i.e. ribosome associated RNA is preferred for this topic 2 at least some dry lab results need to be validated with wet lab experiments 3 studies successfully uncovering biomarker related disease mechanisms will be highly preferred

different elements of plant defense mechanisms responses that influence disease and the physiological state of host plants Nevertheless plant hosts are not static and defenseless Plants have developed active and dynamic complex defense mechanisms to protect themselves against different pathogenic stressors Plants defense mechanisms consist of multi elements and can be determined by pre formed natural barriers or inducible defense responses directly activated upon detection of a pathogen The inducible response is defined as basal resistance or innate immunity and is regulated by signal transduction and transcriptional networks Moreover plant responses to pathogens are finely tuned and complex at the immune receptor cellular proteome epigenetic and transcriptome levels We can tell that a sophisticated molecular arms race is taking place in the biological co evolution of plant pathogen interactions especially in developing novel elements involved in this interaction Therefore a comprehensive understanding of the broad spectrum and underlying elements of defense mechanisms in the interactions between plants and their pathogenic enemies will improve plant resistance to pathogens
