

Study Guide: Physical and Chemical Oceanography

Effective composition of seawater is determined by:

- 1) Primary salinity - given amount of dissolved solids with respect to total weight, freshwater composition is 96.5% composition
- 2) Source - water moving through salt balance from atmosphere through evaporation and precipitation, resulting in salinity variations, freshwater and all dissolved substances
- 3) Secondary salinization process - physical, chemical, biological, hydrological, and other changes, atmospheric air mass leads to lower salt content in rain

Effective salinity and composition in salinity:

- 1) Equivalent - same composition, same weight
- 2) Equivalent - same composition, same weight, same weight

How temperature and salinity produce density, water volume, and pressure:

Temperature differences cause water density:

- 1) Temperature - water density is higher at lower temperature
- 2) Volume - water density is higher at lower temperature
- 3) Volume - water density is higher at lower temperature, the density increases as the temperature is lowered to 4°C, the density is higher

Salinity differences cause water density:

- 1) Salinity - water density is higher at higher salinity
- 2) Volume - water density is higher at higher salinity, the density increases as the salinity is higher
- 3) Volume - water density is higher at higher salinity, the density increases as the salinity is higher
