Nugayev, 2025-04-29 The present book elicits the reasons for the second scientific revolution According to Chapter 1 one has to abandon the great genius approach in favor of mundane Heidegger s existential analytic with Dasein as a way of life shared by the members of scientific community Scientific revolutions should be considered as clashes of diverse mathematical projections of nature consisting of bundles of practices In Chapter 2 it is revealed that Quantum and the Relativistic revolutions had a common origin a skirmish between the Newtonian mechanics Maxwellian electrodynamics Boltzmann s statistical mechanics and Thomson s thermodynamics The skirmish was disclosed by Planck who stressed that the paradigms must be modified to remain compatible Planck took the first step while Einstein took the next ones owing to light quanta and special relativity According to Chapter 3 general relativity was better than its rivals for the reason that it encompassed them all **The long and short of mental time travel-- self-projection over time-scales large and small** James M. Broadway, Claire M. Zedelius, Jonathan W. Schooler, Simon Grondin, 2015-07-02 Researchers working in many fields of psychology and neuroscience are interested in the temporal structure of experience as well as the experience of time at scales of a few milliseconds up to a few seconds as well as days months years and beyond This Research Topic supposes that broadly speaking the field of time psychology can be organized by distinguishing between perceptual and conceptual time scales Dealing with conceptual time mental time travel also called mental simulation self projection episodic semantic memory prospection foresight allows humans and perhaps other animals to imagine and plan

events and experiences in their personal futures based in large part on memories of their personal pasts as well as general knowledge. Moreover, contents of human language and thought are fundamentally organized by a temporal dimension enmeshed with it so thoroughly that it is usually expressible only through spatial metaphors. But what might such notions have to do with experienced durations of events lasting milliseconds up to a few seconds during the so-called present moment of perception-action cycle time? This Research Topic is organized around the general premise that by considering how mental time travel might scale down to time perception and vice versa, no less progress and integrative synthesis within and across scientific domains might be facilitated. Bipolar configurations of future and past orientations of the self may be repeated in parallel across conceptual and perceptual time scales subsumed by a general Janus-like feedforward-feedback system for goal pursuit. As an example, it is notable that the duality of prospective and semantic episodic memory operating at conceptual time scales has an analogue in perception-action cycle time, namely the interplay of anticipatory attention and working memory. Authors from all areas of psychology and neuroscience are encouraged to submit articles of any format accepted by the journal: Original Research, Methods, Hypothesis, Theory, Reviews, etc., which might speak to questions about time and temporal phenomena at long and/or short time scales.

Neuroergonomics Hasan Ayaz, Frederic Dehais, 2018-11-21. Neuroergonomics: The Brain at Work and in Everyday Life details the methodologies that are useful for keeping an ideal human-machine system up to date along with information on how to prevent potential overload and minimize errors. It discusses neural measures and the proper methods and technologies to maximize performance, thus providing a resource for neuroscientists who want to learn more about the technologies and real-time tools that can help them assess cognitive and motivational states of human operators and close the loop for advanced human-machine interaction. With the advent of new and improved tools that allow monitoring of brain activity in the field and better identification of neurophysiological markers that can index impending overload or fatigue, this book is a timely resource on the topic. Includes neurobiological models to better understand risky decision making and cognitive countermeasures, augmented cognition and brain stimulations to enhance performance and mitigate human error. Features innovative methodologies and protocols using psychophysiological measurements and brain imaging techniques in realistic operational settings. Discusses numerous topics including cognitive performance in psychological and neurological disorders, brain

computer interfaces BCI and human performance monitoring in ecological conditions virtual reality and serious gaming
