Conclusion Acknowledgments References** Ljubiša Stanković,2020 Modern data analytics applications on graphs often operate on domains where graph topology is not known a priori and hence its determination becomes part of the problem definition rather than serving as prior knowledge which aids the problem solution Part III of this monograph starts by a comprehensive account of ways to learn the pertinent graph topology ranging from the simplest case where the physics of the problem already suggest a possible graph structure through to general cases where the graph structure is to be learned from the data observed on a graph A particular emphasis is placed on the use of standard relationship measures in this context including the correlation and precision matrices together with the ways to combine these with the available prior knowledge and structural conditions such as the smoothness of the graph signals or sparsity of graph connections Next for learning sparse graphs that is graphs with a small number of edges the utility of the least absolute shrinkage and selection operator known as LASSO is addressed along with its graph specific variant the graphical LASSO For completeness both variants of LASSO are derived in an intuitive way starting from basic principles An in depth elaboration of the graph topology learning paradigm is provided through examples on physically well defined graphs such as electric circuits linear heat transfer social and computer networks and springmass systems We also review main trends in graph neural networks GNN and graph convolutional networks GCN from the perspective of graph signal filtering Particular insight is given to the role of diffusion processes over graphs to show that GCNs can be understood from the graph diffusion perspective Given the largely heuristic nature of the existing GCNs their treatment through graph diffusion processes may also serve as a basis for new

designs of GCNs Tensor representation of lattice structured graphs is next considered and it is shown that tensors multidimensional data arrays can be treated a special class of graph signals whereby the graph vertices reside on a high dimensional regular lattice structure The concept of graph tensor networks then provides a unifying framework for learning on irregular domains This part of monograph concludes with an in dept account of emerging applications in financial data processing and underground transportation network modeling By means of portfolio cuts of an asset graph we show how domain knowledge can be meaningfully incorporated into investment analysis In the underground transportation example we demonstrate how graph theory can be used to identify those stations in the London underground network which have the greatest influence on the functionality of the traffic and proceed in an innovative way to assess the impact of a station closure on service levels across the city Splines and Elements of Graphing Data Bassem Jamaleddine,1991 *JMP 11 Essential Graphing* SAS Institute,2013 Start with JMP 11 Essential Graphing to find the ideal graph for your data The book begins with Graph Builder a quick way to create graphs in a drag and drop window Line charts ellipses box plots and maps are just a few of the graphs available in Graph Builder Find information about creating other types of plots bubble plots scatterplots parallel plots and more
