

**A STAR IS BORN – STAGES COMMON TO ALL STARS**

All stars start as a **nebula**. A nebula is a large cloud of gas and dust. Gravity can pull some of the gas and dust in a nebula together. The contracting cloud is then called a **protostar**. A protostar is the earliest stage of a star's life. A star is born when the gas and dust from a nebula become so hot that nuclear fusion starts. Once a star has "turned on" it is known as a **main sequence star**. When a main sequence star begins to run out of hydrogen fuel, the star becomes a **red giant** or **red super giant**.

**THE DEATH OF A LOW OR MEDIUM MASS STAR**

After a low or medium mass star has become a red giant the outer parts grow bigger and drift into space, forming a cloud of gas called a **planetary nebula**. The blue-white hot core of the star that is left behind cools and becomes a **white dwarf**. The white dwarf eventually runs out of fuel and dies as a **black dwarf**.

**THE DEATH OF A HIGH MASS STAR**

A dying red super giant star can suddenly explode. The explosion is called a **supernova**. After the star explodes, some of the materials from the star are left behind. This material may form a neutron star. **Neutron stars** are the remains of high-mass stars. The most massive stars become **black holes** when they die. After a large mass star explodes, a large amount of mass may remain. The gravity of the mass is so strong that gas is pulled inward, pulling more gas into a smaller and smaller space. Eventually, the gravity becomes so strong that nothing can escape, not even light.

(Not drawn to scale)

**Section One - Sequencing**

The stages below are not in the right order. Number the stages in the correct order.

- \_\_\_\_\_ The star begins to run out of fuel and expands into a **red giant** or **red super giant**.
- \_\_\_\_\_ Stars start out as diffused clouds of gas and dust drifting through space. A single one of these clouds is called a **nebula**.
- \_\_\_\_\_ What happens next depends on the mass of the star.
- \_\_\_\_\_ Heat and pressure build in the core of the **protostar** until **nuclear fusion** takes place.
- \_\_\_\_\_ The force of gravity pulls a nebula together forming clumps called **protostars**.
- \_\_\_\_\_ Hydrogen atoms are fused together generating an enormous amount of energy igniting the star causing it to shine.
