this series great strides have been made in identifying many of the agents or classes of substances responsible for carcinogenesis and in delineating their interactions with the cell Clearly the aim of such studies is that once identified these agents can be eliminated from the environment Yet despite these advances and the elimination of some important carcinogenic agents one major problem exists It is a constant monitor of all oncologic study and diminishes the importance of every experiment and of every clinical observation As we noted earlier that problem is our inability to define the malignant cell It is through studies of the fundamental biology of tumors that we seek this definition A vast amount of information has been gathered which describes what this cell does and to a lesser extent how it does it But the why evades us We have been unable to define the malignant cell save in broad terms by comparing it to its normal counterpart The major problem appears to be that the malignant cell does so much It is a chimera mystifyingly composed of normal activities and structures of phenotypic schizophrenia with embryonic fetal and adult characteristics and occasionally a hint of an unclassifiable capacity unique to malignant cells
