**Detection and Estimation of Working Memory States and Cognitive Functions Based on Neurophysiological Measures** Felix Putze,Christian Mühl,Fabien Lotte,Stephen Fairclough,Christian Herff,2019-02-05 Executive cognitive functions like working memory determine the success or failure of a wide variety of different cognitive tasks such as problem solving navigation or planning Estimation of constructs like working memory load or memory capacity from neurophysiological or psychophysiological signals would enable adaptive systems to respond to cognitive states experienced by an operator and trigger responses designed to support task performance e g by simplifying the exercises of a tutor system when the subject is overloaded or by shutting down distractions from the mobile phone The determination of

cognitive states like working memory load is also useful for automated testing assessment or for usability evaluation While there exists a large body of research work on neural and physiological correlates of cognitive functions like working memory activity fewer publications deal with the application of this research with respect to single trial detection and real time estimation of cognitive functions in complex realistic scenarios Single trial classifiers based on brain activity measurements such as electroencephalography functional near infrared spectroscopy physiological signals or eye tracking have the potential to classify affective or cognitive states based upon short segments of data For this purpose signal processing and machine learning techniques need to be developed and transferred to real world user interfaces The goal of this Frontiers Research Topic was to advance the State of the Art in signal based modeling of cognitive processes We were especially interested in research towards more complex and realistic study designs for example collecting data in the wild or investigating the interaction between different cognitive processes or signal modalities Bringing together many contributions in one format allowed us to look at the state of convergence or diversity regarding concepts methods and paradigms

**Systemic Inflammation in Severe Infectious Diseases** Praveen Papareddy, Michal Holub, Mukesh Pasupuleti, Julien Pottecher, Heiko Herwald, 2024-09-30

Hospital acquired infections are common and often result in life threatening complications mostly facing critically ill patients in the intensive care unit. Patients with hospital acquired infections may die from bacteremia, fungal, viral infection or hyperinflammatory complications because of an uncontrolled over activation of the innate immune system with pathological levels of circulating proinflammatory cytokines or from multiorgan failure. In addition to eliciting a robust inflammatory response it paradoxically renders the host in an immunocompromised state at the late stage of the disease progression. Severe infectious diseases including sepsis and septic shock are among the most common reasons for death in hospitals. Sepsis is an infection induced syndrome characterized by a generalized inflammatory state and represents a frequent complication in surgical patients and in immunocompromised patients. Sepsis is a common, expensive and frequently associated with a fatal outcome. Every 3 to 4 seconds somebody dies with sepsis and it is one of the leading causes of death worldwide.
