PRACTICALCENTRE.BLOGSPOT.COM

**Q.1: Define circular motion and give any two examples?**

**Ans: CIRCULAR MOTION:**

When a body moves on the circumference of the circle is called circular motion.

**Examples:**

- The rotation of our earth and other planets around the sun.
- The wheel of moving bicycle.

**Q.2: Define uniform circular motion? Explain it with one example?**

**Ans: UNIFORM CIRCULAR MOTION:**

When a body moves in a circular path with constant speed it is said to be in uniform circular motion.

**Explanation:**

- At any point on the circle the direction of velocity is directed along the tangent to the circle at the point.
- If at any point a body is made free of force it will move tangential to the circle at that point.
- But as the body is moving along the circumference of the circle there must be a force acting towards the center of the circle and this force is called centripetal force.

**Example:**

Consider a body revolving in a circle of radius " $r$ ". Suppose the body be at point " $P$ " initially. After some interval of time it moves to position  $P'$ . The angle  $\angle POP'$  or " $\theta$ " subtended at the centre of circle represents the turning of body during angular displacement.

**Unit:**

The unit of angular displacement is radian.

**Definition Of Radian:**

One radian is the angle subtended at the center of a circle by an arc equal in length to the radius of the circle.

$$1 \text{ radian} = 57.30^\circ$$
