LIGHT

Light is a form of energy that produces in us the sensation of sight.

Reflection of light is the phenomenon of bouncing back of light in the same medium on striking the surface of any object.

The two laws of reflection are :

the incident ray, the reflected ray and the normal (at the point of incidence), all lie in the same plane.

the angle of reflection (r) is always equal to the angle of incidence (i)

$$\angle r = \angle i$$

In a plane mirror, the image of a real object is always

(i) virtual,

(ii) erect

(iii) of same size as the object.

(iv) as far behind the mirror as the object is in front of the mirror.

(v) laterally inverted.

Absolute refractive index(n) of a medium is the ratio of speed of light in vacuum or air(c) to the speed of light in the medium(v) i.e.

$$n = \frac{c}{v}$$

Refraction of light is the phenomenon of change in the path of light in going from one medium to another.

In going from a rarer to a denser medium, the ray of light bends towards normal and in going from a denser to a rarer medium, the ray of light bends away from normal.

Snell's law of refraction,

$$\frac{\sin i}{\sin r} = \frac{n_2}{n_1} = {}^1n_2$$

No refraction occurs, when

(i) it is incident normally on a boundary,

(ii) refractive indices of the two media in contact are equal.

$$n_{21} = \frac{n_2}{n_1} = \frac{v_1}{v_2}$$

$$\text{Lens formula : } \frac{1}{v} - \frac{1}{u} = \frac{1}{f}$$

New Cartesian Sign Convention for spherical lenses:

(i) All distances are measured from optical centre C of the lens.

(ii) The distances measured in the direction of incidence of light are taken as positive and vice-versa.

(iii) All heights above the principal axis of the lens are taken as positive and vice versa.

The linear magnification produced by a lens is

$$m = \frac{h'}{h} = \frac{v}{u}$$

Power of the combination of lenses

$$P = P_1 + P_2 + P_3 \dots$$

According to New Cartesian Sign Convention, for spherical mirror,

(i) All distances are measured from the pole of the spherical mirror.

(ii) The distances measured in the direction of incidence of light are taken as positive and vice-versa.

(iii) The heights above the principal axis of the mirror are taken as positive and vice-versa.

In spherical mirror, focal length (f) = $\frac{\text{Radius of curvature (R)}}{2}$

$$\text{Mirror formula: } \frac{1}{v} + \frac{1}{u} = \frac{1}{f}$$

Linear magnification produced by a spherical mirror is

$$m = \frac{-v}{u} = \frac{\text{size of image (h}_2\text{)}}{\text{size of object (h}_1\text{)}}$$

For a convex mirror, m is +ve and less than one, as the image formed is virtual, erect and shorter than the object.

For a concave mirror, m is +ve when image formed is virtual and m is -ve, when image formed is real.

Quantum Legacies David Kaiser, 2022-06-16 Physicists have grappled with quantum theory for over a century They have learned to wring precise answers from the theory's governing equations and no experiment to date has found compelling evidence to contradict it Even so the conceptual apparatus remains stubbornly famously bizarre Physicists have tackled these conceptual uncertainties while navigating still larger ones the rise of fascism cataclysmic world wars and a new nuclear age an unsteady Cold War stand off and its unexpected end Quantum Legacies introduces readers to physics still unfolding quest by treating iconic moments of discovery and debate among well known figures like Albert Einstein Erwin Schrödinger and Stephen Hawking and many others whose contributions have indelibly shaped our understanding of nature Quantum Mechanics

Andrew J. Larkoski, 2023-01-12 This original and innovative textbook takes the unique perspective of introducing and solving problems in quantum mechanics using linear algebra methods to equip readers with a deeper and more practical understanding of this fundamental pillar of contemporary physics Extensive motivation for the properties of quantum mechanics Hilbert space and the Schrödinger equation is provided through analysis of the derivative while standard topics like the harmonic oscillator rotations and the hydrogen atom are covered from within the context of operator methods Advanced topics forming the basis of modern physics research are also included such as the density matrix entropy and measures of entanglement Written for an undergraduate audience this book offers a unique and mathematically self contained treatment of this hugely important topic Students are guided gently through the text by the author's engaging writing style with an extensive glossary provided for reference and numerous homework problems to expand and develop key concepts Online resources for instructors include a fully worked solutions manual and lecture slides Reduced Kinetic Mechanisms for Applications in Combustion Systems

Norbert Peters, Bernd Rogg, 2008-09-11 In general combustion is a spatially three dimensional highly complex physico chemical process of transient nature Models are therefore needed that simulate to such a degree that it becomes amenable to a given combustion problem to theoretical or numerical analysis but that are not so restrictive as to distort the underlying physics or chemistry In particular in view of worldwide efforts to conserve energy and to control pollutant formation models of combustion chemistry are needed that are sufficiently accurate to allow confident predictions of flame structures Reduced kinetic mechanisms which are the topic of the present book represent such combustion chemistry models Historically combustion chemistry was first described as a global one step reaction in

which fuel and oxidizer react to form a single product Even when detailed mechanisms of elementary reactions became available empirical one step kinetic approximations were needed in order to make problems amenable to theoretical analysis This situation began to change in the early 1970s when computing facilities became more powerful and more widely available thereby facilitating numerical analysis of relatively simple combustion problems typically steady one dimensional flames with moderately detailed mechanisms of elementary reactions However even on the fastest and most powerful computers available today numerical simulations of say laminar steady three dimensional reacting flows with reasonably detailed and hence realistic kinetic mechanisms of elementary reactions are not possible

The Heroic Age Robert D. Purrington, 2018-01-22 Quantum theory is one of the great achievements of twentieth century physics Born at the very beginning of the century it attained a definitive form by 1932 yet continued to evolve throughout the century Its applications remain fully a part of modern life It should thus come as no surprise that literature on the history of quantum theory is vast but author Robert D Purrington approaches the story from a new angle by examining the original physics papers and scientific studies from before the creation of quantum mechanics to how scientists think about and discuss the subject today The Heroic Age presents for the first time a detailed but compact and manageable history of the creation of quantum theory and shows precisely where each important idea originated Purrington provides the history of the crucial developmental years of quantum theory with an emphasis on the literature rather than an overview of this period focusing on personalities or personal stories of the scientists involved This book instead focuses on how the theoretical discoveries came about when and where they were published and how they became accepted as part of the scientific canon

Understanding and Using Radio Waves Elizabeth Rubio, 2021-12-15 When most people hear the term radio waves they think of the radio in their car or

on their desk but radio waves are so much more than a way of listening to music Readers will discover how radio waves are similar to and different from light we can see They ll learn how radio transmitters and receivers work and the difference between AM and FM frequencies Readers will learn about the that roles that radio waves play in space exploration and how they might reveal life on other planets
