Quanser Workbook Solutions Manual:

Software Engineering for Embedded Systems Shelley Gretlein, 2013-04-01 Creating a model for your embedded system provides a time and cost effective approach to the development of simple or incredibly complex dynamic control systems all based on a single model maintained in a tightly integrated software suite Using modern modeling software tools you can design and perform initial validation in off line simulation These models then form the basis for all subsequent development stages Creating models for your embedded design provides numerous advantages over the traditional design approach Using this approach combined with hardware prototyping you reduce the risk of mistakes and shorten the development cycle by performing verification and validation testing throughout the development instead of only during the final testing stage Design evaluations and predictions can be made much more quickly and reliably with a system model as a basis This iterative approach results in improved designs in terms of both performance and reliability The cost of resources is reduced because of reusability of models between design teams design stages and various projects and the reduced dependency on physical prototypes Development errors and overhead can be reduced through the use of automatic code generation techniques These advantages translate to more accurate and robust control designs shorter time to market and reduced design cost
